## Introduction

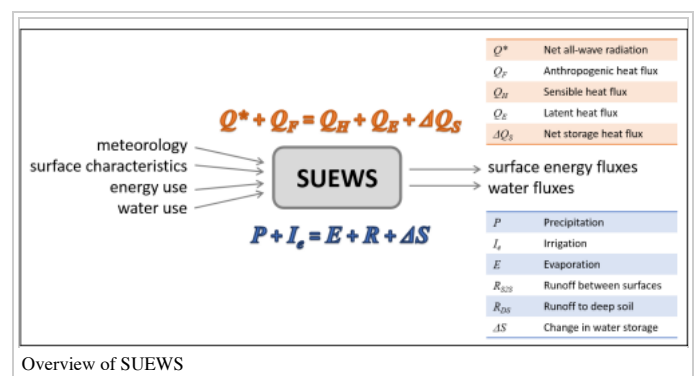

Surface Urban Energy and Water Balance Scheme (**SUEWS**) (Järvi et al. 2011<sup>[1]</sup>, Ward et al. 2016<sup>[2]</sup>) is able to simulate the urban radiation, energy and water balances using only commonly measured meteorological variables and information about the surface cover.

SUEWS utilizes an evaporation-interception approach (Grimmond et al. 1991<sup>[3]</sup>), similar to that used in forests, to model evaporation from urban surfaces.

The model uses seven surface types: paved, buildings, evergreen trees/shrubs, deciduous trees/shrubs, grass, bare soil and water. The surface state for each surface type at each time step is calculated from the running water balance of the canopy where the evaporation is calculated from the Penman-Monteith equation. The soil moisture below each surface type (excluding water) is taken into account.

Horizontal movement of water above and below ground level is allowed. The user can specify the model time-step, but 5 min is strongly recommended. The main output file is provided at a resolution of 60 min by default. The model provides the radiation and energy balance components, surface and soil wetness, surface and soil runoff and the drainage for each surface. Timestamps refer to the end of the averaging period.

Model applicability: SUEWS is a neighbourhood-scale or local-scale model.

## SUEWS and UMEP

SUEWS can be run as a standalone model but also can be used within UMEP ([http://urban-climate.net/umep/UMEP\\_Manual](http://urban-climate.net/umep/UMEP_Manual)). There are numerous tools included within UMEP to help a user get started. The SUEWS simple ([http://urban-climate.net/umep/UMEP\\_Manual#Urban\\_Energy\\_Balance:\\_Urban\\_Energy\\_Balance\\_.28SUEWS.2C\\_simple.29](http://urban-climate.net/umep/UMEP_Manual#Urban_Energy_Balance:_Urban_Energy_Balance_.28SUEWS.2C_simple.29)) within UMEP is a fast way to start using SUEWS.

The version of SUEWS within UMEP is the complete model. Thus all options that are listed in this manual are available to the user. In the UMEP SUEWS simple ([http://urban-climate.net/umep/UMEP\\_Manual#Urban\\_Energy\\_Balance:\\_Urban\\_Energy\\_Balance\\_.28SUEWS.2C\\_simple.29](http://urban-climate.net/umep/UMEP_Manual#Urban_Energy_Balance:_Urban_Energy_Balance_.28SUEWS.2C_simple.29)) runs all options are set to values to allow initial exploration of the model behaviour.

The version of SUEWS within UMEP is a more recent release of the model than the independent SUEWS release.

| UMEP  |                      |  | Description   |
|---|----------------------|--|---|
| Pre-Processor   | Meteorological Data  | Prepare Existing Data ( <a href="http://urban-climate.net/umep/UMEP_Manual#Meteorological_Data:_MetPreprocessor">http://urban-climate.net/umep/UMEP_Manual#Meteorological_Data:_MetPreprocessor</a> )  | Transforms meteorological data into UMEP format.  |
|   |                      | Download data (WATCH) ( <a href="http://www.urban-climate.net/umep/UMEP_Manual#Meteorological_Data:_Download_data_.28WATCH.29">http://www.urban-climate.net/umep/UMEP_Manual#Meteorological_Data:_Download_data_.28WATCH.29</a> )  | Prepare meteorological dataset from WATCH ( <a href="http://www.eu-watch.org/data">http://www.eu-watch.org/data</a> ) |
|   | Spatial Data         | Spatial Data Downloader ( <a href="http://www.urban-climate.net/umep/UMEP_Manual#Spatial_Data:_Spatial_Data_Downloader">http://www.urban-climate.net/umep/UMEP_Manual#Spatial_Data:_Spatial_Data_Downloader</a> )  | Plugin for retrieving geodata from open services suitable for UMEP related analyses.                                  |
|   |                      | LCZ Converter ( <a href="http://www.urban-climate.net/umep/UMEP_Manual#Spatial_Data:_LCZ_Converter">http://www.urban-climate.net/umep/UMEP_Manual#Spatial_Data:_LCZ_Converter</a> )  | Conversion from Climate Zones to the WUDAPT format into SUEWS input.  |
|   | Urban land cover     | Land Cover Reclassifier ( <a href="http://urban-climate.net/umep/UMEP_Manual#Urban_Land_Cover:_Land_Cover_Reclassifier">http://urban-climate.net/umep/UMEP_Manual#Urban_Land_Cover:_Land_Cover_Reclassifier</a> )  | Reclassifies a given UMEP format into a grid. <i>Land surface cover</i>   |
|   |                      | Land Cover Fraction (Point) ( <a href="http://urban-climate.net/umep/UMEP_Manual#Urban_Land_Cover:_Land_Cover_Reclassifier">http://urban-climate.net/umep/UMEP_Manual#Urban_Land_Cover:_Land_Cover_Reclassifier</a> )  | Land cover fraction estimates from grid based on a point in space.  |
|   |                      | Land Cover Fraction (Grid) ( <a href="http://urban-climate.net/umep/UMEP_Manual#Urban_Land_Cover:_Land_Cover_Fraction_.28Grid.29">http://urban-climate.net/umep/UMEP_Manual#Urban_Land_Cover:_Land_Cover_Fraction_.28Grid.29</a> )   | Land cover fraction estimates from grid based on a grid.  |
|   | Urban Morphology     | Morphometric Calculator (Point) ( <a href="http://urban-climate.net/umep/UMEP_Manual#Urban_Morphology:_Morphometric_Calculator_.28Point.29">http://urban-climate.net/umep/UMEP_Manual#Urban_Morphology:_Morphometric_Calculator_.28Point.29</a> )                              | Morphometric data from a DSM based on a specific point in space.  |
|   |                      | Morphometric Calculator (Grid) ( <a href="http://urban-climate.net/umep/UMEP_Manual#Urban_Morphology:_Morphometric_Calculator_.28Grid.29">http://urban-climate.net/umep/UMEP_Manual#Urban_Morphology:_Morphometric_Calculator_.28Grid.29</a> )                                 | Morphometric data estimated from a grid based on a polygon.   |
|   |                      | Source Area Model (Point) ( <a href="http://urban-climate.net/umep/UMEP_Manual#Urban_Morphology:_Source_Area_.28Point.29">http://urban-climate.net/umep/UMEP_Manual#Urban_Morphology:_Source_Area_.28Point.29</a> )  | Source area calculation from a DSM based on a point in space.   |
| SUEWS Prepare ( <a href="http://urban-climate.net/umep/UMEP_Manual#Pre-Processor:_SUEWS_Prep">http://urban-climate.net/umep/UMEP_Manual#Pre-Processor:_SUEWS_Prep</a> ) |                      |  | Preprocessing and preparing input for the SUEWS model.  |
| Processor   | Urban Energy Balance | Anthropogenic Heat ( $Q_F$ ) (LQF)   | Spatial variation of anthropogenic heat flux for urban areas.   |
|   |                      | GQF ( <a href="http://www.urban-climate.net/umep/UMEP_Manual#Urban_Energy_Balance:_GQF">http://www.urban-climate.net/umep/UMEP_Manual#Urban_Energy_Balance:_GQF</a> )  | Anthropogenic heat flux.  |
|   |                      | SUEWS (Simple) ( <a href="http://urban-climate.net/umep/UMEP_Manual#Urban_Energy_Balance:_Urban_Energy_Balance_.28SUEWS.2C_simple.29">http://urban-climate.net/umep/UMEP_Manual#Urban_Energy_Balance:_Urban_Energy_Balance_.28SUEWS.2C_simple.29</a> )                         | Urban Energy Balance.   |
|   |                      | SUEWS (Advanced) ( <a href="http://urban-climate.net/umep/UMEP_Manual#Urban_Energy_Balance:_Urban_Energy_Balance_.28SUEWS.2FBLUEWS.2C_advanced.29">http://urban-climate.net/umep/UMEP_Manual#Urban_Energy_Balance:_Urban_Energy_Balance_.28SUEWS.2FBLUEWS.2C_advanced.29</a> ) | Urban Energy Balance.   |
| Post-Processor  | Urban Energy Balance | SUEWS analyser ( <a href="http://urban-climate.net/umep/UMEP_Manual#Urban_Energy_Balance:_SUEWS_Analyser">http://urban-climate.net/umep/UMEP_Manual#Urban_Energy_Balance:_SUEWS_Analyser</a> )   | Plugin for plotting statistical analysis results from SUEWS simple and SUEWS advanced.                                |
|   | Benchmark            | Benchmark System ( <a href="http://urban-climate.net/umep/UMEP_Manual#Benchmark_System">http://urban-climate.net/umep/UMEP_Manual#Benchmark_System</a> )   | For statistical analysis of model results, comparing SUEWS results with observed data.                                |

## Parameterisations and sub-models within SUEWS

### Net all-wave radiation, $Q^*$

There are several options for modelling or using observed radiation components depending on the data available. As a minimum, SUEWS requires incoming shortwave radiation to be provided.

1. Observed net all-wave radiation can be provided as input instead of being calculated by the model.
2. Observed incoming shortwave and incoming longwave components can be provided as input, instead of incoming longwave being calculated by the model.
3. Other data can be provided as input, such as cloud fraction (see options in RunControl).
4. **NARP** (Net All-wave Radiation Parameterization, Offerle et al. 2003<sup>[4]</sup>, Loricán et al. 2011<sup>[5]</sup>) scheme calculates outgoing shortwave and incoming and outgoing longwave radiation components based on incoming shortwave radiation, temperature, relative humidity and surface characteristics (albedo, emissivity).

### Anthropogenic heat flux, $Q_F$

1. Two simple anthropogenic heat flux sub-models exist within SUEWS:
  - Järvi et al. (2011)<sup>[1]</sup> approach, based on heating and cooling degree days and population density (allows distinction between weekdays and weekends).

- Loridan et al. (2011)<sup>[5]</sup> approach, based on a linear piece-wise relation with air temperature.
- 2. Pre-calculated values can be supplied with the meteorological forcing data, either derived from knowledge of the study site, or obtained from other models, for example:
  - **LUCY** (Allen et al. 2011<sup>[6]</sup>, Lindberg et al. 2013<sup>[7]</sup>)
  - **GreaterQF** (Iamarino et al. 2011<sup>[8]</sup>)

## Storage heat flux, $\Delta Q_S$

1. Three sub-models are available to estimate the storage heat flux:
  - **OHM** (Objective Hysteresis Model, Grimmond et al. 1991<sup>[9]</sup>, Grimmond & Oke 1999a<sup>[10]</sup>, 2002<sup>[11]</sup>). Storage heat flux is calculated using empirically-fitted relations with net all-wave radiation and the rate of change in net all-wave radiation.
  - **AnOHM** (Analytical Objective Hysteresis Model, Sun et al. 2017<sup>[12]</sup>). OHM approach using analytically-derived coefficients. (**Not available in v2017a**)
  - **ESTM** (Element Surface Temperature Method, Offerle et al. 2005<sup>[13]</sup>). Heat transfer through urban facets (roof, wall, road, interior) is calculated from surface temperature measurements and knowledge of material properties. (**Not available in v2017a**)
2. Alternatively, 'observed' storage heat flux can be supplied with the meteorological forcing data.

## Turbulent heat fluxes, $Q_H$ and $Q_E$

1. **LUMPS** (Local-scale Urban Meteorological Parameterization Scheme, Grimmond & Oke 2002<sup>[11]</sup>) provides a simple means of estimating sensible and latent heat fluxes based on the proportion of vegetation in the study area.
2. **SUEWS** adopts a more biophysical approach to calculate the latent heat flux; the sensible heat flux is then calculated as the residual of the energy balance. The initial estimate of stability is based on the LUMPS calculations of sensible and latent heat flux. (Additionally, sensible heat flux can be calculated using the resistance method - **this option is not available in v2017a**.)

Sensible and latent heat fluxes from both LUMPS and SUEWS are provided in the model output. Whether the turbulent heat fluxes are calculated using LUMPS or SUEWS can have a major impact on the results. For SUEWS, an appropriate surface conductance parameterisation is also critical<sup>[1][2]</sup>. For more details see Differences between SUEWS, LUMPS and FRAISE.

## Water balance

The running water balance at each time step is based on the urban water balance model of Grimmond et al. (1986)<sup>[14]</sup> and urban evaporation-interception scheme of Grimmond and Oke (1991)<sup>[3]</sup>.

- Precipitation is a required variable in the meteorological forcing file.
- Irrigation can be modelled<sup>[1]</sup> or observed values can be provided if data are available.
- Drainage equations and coefficients to use must be specified in the input files.
- Soil moisture can be calculated by the model or observations can be provided (**N.B. use of observed soil moisture not possible in v2017a**).
- Runoff is permitted:
  - between surface types within each model grid
  - between model grids (**Not implemented in v2017a**)
  - to deep soil
  - to pipes.

## Snowmelt

The snowmelt model within SUEWS is described in Järvi et al. (2014)<sup>[15]</sup>. Due to changes in the new model version (since v2016a) when compared to the older versions, the snow calculation has slightly changed. The main difference is that previously all surface state could freeze in 1-h time step but now the amount of freezing surface state is calculated similar way as melt water can freeze within the snow pack. Also the snowmelt-related coefficients have slightly changed (see SUEWS\_Snow.txt).

## Convective boundary layer

A convective boundary layer (CBL) slab model (Cleugh and Grimmond 2001<sup>[16]</sup>) calculates the CBL height, temperature and humidity during daytime (Onomura et al. 2015<sup>[17]</sup>).

## Thermal comfort

**SOLWEIG** (Solar and longwave environmental irradiance geometry model, Lindberg et al. 2008<sup>[18]</sup>, Lindberg and Grimmond 2011<sup>[19]</sup>) is a 2D radiation model to estimate mean radiant temperature.

## Preparing to run the model

The following provides some comments to help with the model setup. Note that there is a version of SUEWS in UMEP ([http://urban-climate.net/umep/UMEP\\_Manual](http://urban-climate.net/umep/UMEP_Manual)) and there are some starting tutorials ([http://urban-climate.net/umep/UMEP\\_Manual#Tutorials](http://urban-climate.net/umep/UMEP_Manual#Tutorials)) for that. The version there is the same (i.e. the executable) as the standalone version so you can swap to that later once you have some familiarity.

## Preparatory reading

Read the manual and relevant papers (and references therein):

| SUEWS with SOLWEIG                         | No                        |
| SUEWS with SOLWEIG and BL                  | No                        |

Download the program and example data files (\*\*Update for v2017a\*\*)

Visit the website to receive a link to download the program and example data files. Select the appropriate compiled version of the model to download. For windows there is an installation version which will put the programs and all the files into the appropriate place. There is also a version linked to QGIS: **UMEP** (<http://urban-climate.net/umep/UMEP>).

Note, as the definition of long double precision varies between computers (e.g. Mac vs Windows) slightly different results may occur in the output files.

Test/example files are given for the Vancouver Sunset site, 1987 data (denoted Vs87)

In the following SS is the site code (e.g. Vs), ss the grid ID, YYYY the year and tt the time interval.

| Filename                          | Description  | Input/output                      |
|-----------------------------------|--|-----------------------------------|
| SSss_data.txt                     | Meteorological input file (60-min)                 | Input                             |
| SSss_YYYY_data_5.txt              | Meteorological input file (5-min)                  | Input                             |
| InitialConditionsSSss_YYYY.nml(+) | Initial conditions file                            | Input                             |
| SUEWS_v2016a_SiteInfo_SSss.xlsm   | Spreadsheet containing all other input information | Input                             |
| RunControl.nml                    | Sets model run options                             | Input (located in main directory) |
| SS_Filechoices.txt                | Summary of model run options                       | Output                            |
| SSss_YYYY_5.txt                   | (Optional) 5-min resolution output file            | Output                            |
| SSss_YYYY_60.txt                  | 60-min resolution output file                      | Output                            |
| SSss_DailyState.txt               | Daily state variables (all years in one file)      | Output                            |

(+) There is a second file InitialConditionsSSss\_YYYY\_EndOfRun.nml or InitialConditionsSSss\_YYYY+1.nml in the input directory. At the end of the run, and at the end of each year of the run, these files are written out so that this information could be used to initialize further model runs.

Run the model for example data

Before running the model for your own data it is good to make certain that you can run the test data and get the same results as in the example files provided. It is recommended that you make a copy of the example output files and put them somewhere else so you can compare the results. When you run the program it will write over the supplied files.

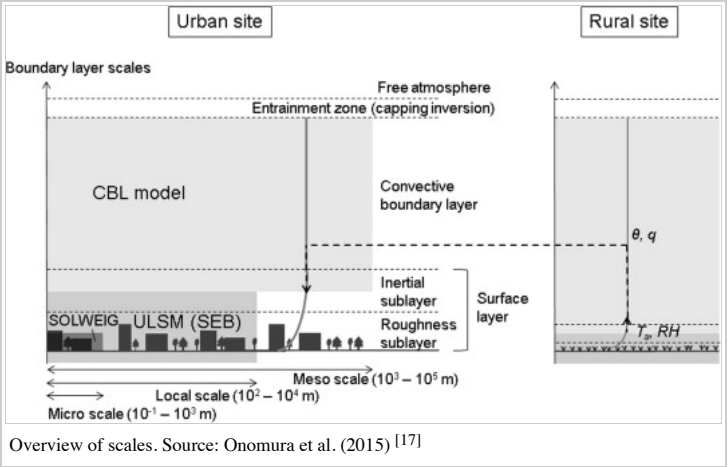

To run the model you can use **Command Prompt** (in the directory where the programme is located type the model name) or just double click the executable file.

Please see Troubleshooting if you have problems running the model.

Preparation of data

This section describes the information required to run SUEWS for your site. The input data can be summarised as follows:

1. Continuous *meteorological forcing data* for the entire period to be modelled.
2. Knowledge of the *surface and soil conditions immediately before the start of the run* (if these initial conditions are not known, it is usually possible to determine suitable values by running the model and using the output at the end of the run to infer the conditions at the start of the run).
3. The *location of the site* (latitude, longitude, altitude).

4. Information about the *characteristics of the surface*, including land cover, heights of buildings and trees, radiative characteristics (e.g. albedo, emissivity), drainage characteristics, soil characteristics, snow characteristics, phenological characteristics (e.g. seasonal cycle of LAI).
5. Information about *human behaviour*, including energy use and water use (e.g. for irrigation or street cleaning) and snow clearing (if applicable). The anthropogenic energy use and water use may be provided as a time series in the meteorological forcing file if these data are available or modelled based on parameters provided to the model, including population density, hourly and weekly profiles of energy and water use, information about the proportion of properties using irrigation and the type of irrigation (automatic or manual).

It is particularly important to ensure the following input information is appropriate and representative of the site:

- Fractions of different land cover types and (less so) heights of buildings<sup>[2]</sup>
- Accurate meteorological forcing data, particularly precipitation and incoming shortwave radiation<sup>[20]</sup>
- Initial soil moisture conditions<sup>[21]</sup>
- Anthropogenic heat flux parameters, particularly if there are considerable energy emissions from transport, buildings, metabolism, etc<sup>[2]</sup>
- External water use (if irrigation or street cleaning occurs)
- Snow clearing (if running the snow option)
- Surface conductance parameterisation<sup>[1][2]</sup>

SUEWS can be run either for an individual area or for multiple areas. There is no requirement for the areas to be of any particular shape but here we refer to them as model 'grids'.

### Preparation of site characteristics and model parameters

The area to be modelled is described by a set of characteristics that are specified in the SUEWS\_SiteSelect.txt file. Each row corresponds to one model grid for one year (i.e. running a single grid over three years would require three rows; running two grids over two years would require four rows). Characteristics are often selected by a code for a particular set of conditions. For example, a specific soil type (links to SUEWS\_Soil.txt) or characteristics of deciduous trees in a particular region (links to SUEWS\_Veg.txt). The intent is to build a library of characteristics for different types of urban areas. The codes are specified by the user, must be integer values and must be unique within the first column of each input file, otherwise the model will return an error. (Note in SUEWS\_SiteSelect.txt the first column is labelled 'Grid' and can contain repeat values for different years.) See Input files for details.

#### Land cover

For each grid, the land cover must be classified using the following surface types:

| Classification | Surface type               | File where characteristics are specified |
|----------------|----------------------------|--|
| Non-vegetated  | Paved surfaces             | SUEWS_NonVeg.txt                         |
|                | Building surfaces          | SUEWS_NonVeg.txt                         |
|                | Bare soil surfaces         | SUEWS_NonVeg.txt                         |
| Vegetation     | Evergreen trees and shrubs | SUEWS_Veg.txt                            |
|                | Deciduous trees and shrubs | SUEWS_Veg.txt                            |
|                | Grass                      | SUEWS_Veg.txt                            |
| Water          | Water                      | SUEWS_Water.txt                          |
| Snow           | Snow                       | SUEWS_Snow.txt                           |

The surface cover fractions (i.e. proportion of the grid taken up by each surface) must be specified in SUEWS\_SiteSelect.txt. The surface cover fractions are **critical**, so make certain that the different surface cover fractions are appropriate for your site.

For some locations, land cover information may be already available (e.g. from various remote sensing resources). If not, websites like Bing Maps and Google Maps allow you to see aerial images of your site and can be used to estimate the relative proportion of each land cover type. If detailed spatial datasets are available, UMEP (<http://urban-climate.net/umep/UMEP>) allows for a direct link to a GIS environment using QGIS.

#### Anthropogenic heat flux

The population density is needed as an input for LUMPS and SUEWS to calculate QF. If you have no information about the population of the site we recommend that you use the LUCY model<sup>[6] [7]</sup> to estimate the anthropogenic heat flux which can then be provided as input SUEWS along with the meteorological forcing data. The LUCY model can be downloaded from here (<http://micromet.reading.ac.uk/>).

#### Other information

The surface cover fractions and population density can have a major impact on the model output. However, it is important to consider the suitability of all parameters for your site. Using inappropriate parameters may result in the model returning an error or, worse, generating output that is simply not representative of your site. Please read the section on Input files. Recommended or reasonable ranges of values are suggested for some parameters, along with important considerations for how to select appropriate values for your site.

#### Data Entry

To create the series of input text files describing the characteristics of your site, there are three options:

1. Data can be entered directly into the input text files. The example (.txt) files provide a template to create your own files which can be edited with a text editor directly.
2. Data can be entered into the spreadsheet **SUEWS\_v2017a\_SiteInfo.xlsm** and the input text files generated by running the macro.
3. Use UMEP (<http://urban-climate.net/umep/UMEP%7C>).

**To run the xlsx macro:** Enter the data for your site into the xlsx spreadsheet **SUEWS\_v2017a\_SiteInfo.xlsm** and then use the macro to create the text files which will appear the same directory.

If there is a problem

- Make sure none of the text files to be generated are open.
- It is recommended to close the spreadsheet before running the actual model code.

Note that in all txt files:

- The first two rows are headers. The first row is the column number; the second row is the column name.
- The names and order of the columns should not be altered from the templates, as these are checked by the model and errors will be returned if particular columns cannot be found.
- All files should have two rows with -9 in column 1 as their last two rows. Since v2017a this is no longer necessary for the meteorological forcing data files.
- “!” indicates a comment, so any text following “!” on the same line will not be read by the model.
- If data are unavailable or not required, enter the value -999 in the correct place in the input file.
- Ensure the units are correct for all input information. See Input files for a description of parameters.

In addition to these text files, the following files are also needed to run the model.

### Preparation of the RunControl file

In the RunControl.nml file the site name (SS\_) and directories for the model input and output are given. This means **before running** the model (even the with the example datasets) you must either

1. open the RunControl.nml file and edit the input and output file paths and the site name (with a text editor) so that they are correct for your setup, or
2. create the directories specified in the RunControl.nml file

From the given site identification the model identifies the input files and generates the output files. For example if you specify

```
FileOutputPath = "C:\FolderName\SUEWSOutput\" and use site code SS the model creates an output file
C:\FolderName\SUEWSOutput\SSss_YYYY_TT.txt (remember to add the last backslash in windows and slash in Linux/Mac).
```

If the file paths are not correct the program will return an error when run (see error messages) and write the error to the problems.txt file.

### Preparation of the Meteorological forcing data

The model time-step is specified in RunControl.nml (5 min is highly recommended). If meteorological forcing data are not available at this resolution, SUEWS has the option to downscale (e.g. hourly) data to the time-step required. See details about the meteorological forcing data to learn more about choices of data input. Each grid can have its own meteorological forcing file, or a single file can be used for all grids. The forcing data should be representative of the local-scale, i.e. collected (or derived) above the height of the roughness elements (buildings and trees).

### Preparation of the InitialConditions file

Information about the surface state and meteorological conditions just before the start of the run are provided in the Initial Conditions file. At the very start of the run, each grid can have its own Initial Conditions file, or a single file can be used for all grids. For details see InitialConditions.

### Run the model for your site

To run the model you can use **Command Prompt** (in the directory where the programme is located type the model name) or just double click the executable file.

Please see Troubleshooting if you have problems running the model.

### Analyse the output

It is a good idea to perform initial checks that the model output looks reasonable.

| Characteristic  | Things to check   |
|-----------------|---|
| Leaf area index | Does the phenology look appropriate (i.e. what does the seasonal cycle of leaf area index (LAI) look like?) <ul style="list-style-type: none"> <li>▪ Are the leaves on the trees at approximately the right time of the year?</li> </ul>  |
| Kdown           | Is the timing of the diurnal cycle correct? <ul style="list-style-type: none"> <li>▪ Although Kdown is a required input, it is also included in the output file. It is a good idea to check that the timing of Kdown in the output file is appropriate, as problems can indicate errors with the timestamp, incorrect time settings or problems with the disaggregation. In particular, make sure the sign of the longitude is specified correctly in SUEWS_SiteSelect.txt.</li> <li>▪ Checking solar angles (zenith and azimuth) can also be a useful check that the timing is correct.</li> </ul> |
| Albedo          | Is the bulk albedo correct? <ul style="list-style-type: none"> <li>▪ This is critical because a small error has an impact on all the fluxes (energy and hydrology).</li> <li>▪ If you have measurements of outgoing shortwave radiation compare these with the modelled values.</li> <li>▪ How do the values compare to literature values for your area?</li> </ul>   |

### Summary of files

The table below lists the files required to run SUEWS and the output files produced. SS is the two-letter code (specified in RunControl) representing the site name, ss is the grid identification (integer values between 0 and 2,147,483,647 (largest 4-byte integer)) and YYYY is the year. TT is the resolution of the input/output file and tt is the model time-step.

The last column indicates whether the files are needed/produced once per run (1/run), or once per day (1/day), for each year (1/year) or for each grid (1/grid).

[B] indicates files used with the CBL part of SUEWS (BLUEWS) and therefore are only needed/produced if this option is selected  
 [E] indicates files associated with ESTM storage heat flux models and therefore are only needed/produced if this option is selected

| Filename   | Description   | Location   | Option                          |
|--|---|--|---------------------------------|
| <b>Program</b>                                   |   |  |                                 |
| SUEWS_V2017a.exe                                 | SUEWS executable  | Directory where the program will run                                 |                                 |
| <b>Input files</b>                               |   |  |                                 |
| RunControl.nml                                   | Specifies options for the model run   | Same directory as executable   | 1/run                           |
| SUEWS_SiteSelect.txt                             | Main input file for this site   | Input directory  | 1/run                           |
| SUEWS_NonVeg.txt                                 | Inputs for non-vegetated surfaces   | Input directory  | 1/run                           |
| SUEWS_Veg.txt                                    | Inputs for vegetated surfaces   | Input directory  | 1/run                           |
| SUEWS_Water.txt                                  | Inputs for water surfaces   | Input directory  | 1/run                           |
| SUEWS_Snow.txt                                   | Inputs for snow   | Input directory  | 1/run                           |
| SUEWS_Soil.txt                                   | Inputs for sub-surface soil   | Input directory  | 1/run                           |
| SUEWS_AnthropogenicHeat.txt                      | Inputs for anthropogenic heat flux  | Input directory  | 1/run                           |
| SUEWS_Irrigation.txt                             | Inputs for irrigation   | Input directory  | 1/run                           |
| SUEWS_Profiles.txt                               | Inputs for hourly profiles (energy use, water use, snow-clearing)   | Input directory  | 1/run                           |
| SUEWS_WithinGridWaterDist.txt                    | Inputs describing within-grid water distribution  | Input directory  | 1/run                           |
| SUEWS_OHMCoefficients.txt                        | Inputs for OHM coefficients   | Input directory  | 1/run                           |
| SUEWS_Conductance.txt                            | Inputs for surface conductance  | Input directory  | 1/run                           |
| SUEWS_v2017a_SiteInfo.xlsm                       | (Optional) spreadsheet for creating input files   | Anywhere, but the input files created must be in the input directory | -                               |
| SSss_YYYY_data_tt.txt /<br>SSss_YYYY_data_TT.txt | Meteorological input file at model time-step (tt) / lower resolution (TT)   | Input directory  | 1/grid/year<br>or 1/year        |

| CBLinput.nml                                     | Specifies options and inputs for CBL model  | Input directory  | 1/run [B]                       |
| CBL_initial_data.txt                             | Initial data for CBL model  | Input directory  | 1/day [B]                       |
| <b>Output files</b>                              |   |  |                                 |
| SSss_YYYY_tt.txt                                 | Model output at model time-step (optional)  | Output directory   | 1/grid/year                     |
| SSss_YYYY_TT.txt                                 | Model output at resolution specified by ResolutionFilesOut  | Output directory   | 1/grid/year                     |
| SSss_DailyState.txt                              | Status at a daily time step   | Output directory   | 1/grid                          |
| InitialConditionsSSss_YYYY+1.nml                 | New InitialConditions file written for each grid at the end of each year for multi-year runs. If the run finishes before the end of the year the InitialConditions file is still written and the file name is appended with '_EndofRun' | Input directory  | 1/grid/year                     |
| SS_FileChoices.txt                               | Summary of model run options  | Output directory   | 1/run                           |
| SS_YYYY_TT_OutputFormat.txt                      | Describes header, units and formatting of the main output file  | Output directory   | 1/run                           |
| SSss_YYYY_ESTM_tt.txt                            | Model output at model time-step (optional)  | Output directory   | 1/grid/year<br>[E]              |
| SSss_YYYY_ESTM_TT.txt                            | Model output at resolution specified by ResoltuionFilesOut  | Output directory   | 1/grid/year<br>[E]              |
| problems.txt                                     | Contains details of serious errors encountered in the model run   | Same directory as executable   | 1/run                           |
| warnings.txt                                     | List of potential issues encountered in the model run   | Same directory as executable   | 1/run                           |
| CBL_id.txt                                       | CBL model output file for day of year id  | Output directory   | 1/day [B]                       |

## Input files

SUEWS allows you to input a large number of parameters to describe the characteristics of your site. You should not assume that the example values provided in files or in the tables below are appropriate. Values marked with 'MD' are examples of recommended values (see the suggested references to help decide how appropriate these are for your site/model domain); values marked with 'MU' need to be set (i.e. changed from the example) for your site/model domain.

## RunControl.nml

The file **RunControl.nml** is a namelist that specifies the options for the model run. It must be located in the same directory as the executable file.

The format should be:

```
&RunControl
Parameters and variables (see table below)
/
```

In *Linux* and *Mac*, please add an empty line after the end slash.

- The file is not case-sensitive.
- The parameters and variables can appear in any order.

| Name   | Required/Optional | Description   |   |
|--|-------------------|---|---|
| Model run options  |                   |   |   |
| CBLuse   | R                 | Determines whether a CBL slab model is used to calculate temperature and humidity.  |   |
|  |                   | Value   | Comments  |
|  |                   | 0   | CBL model <b>not</b> used. SUEWS and LUMPS use temperature and humidity provided in the meteorological forcing file.  |
|  |                   | 1   | CBL model is used to calculate temperature and humidity used in SUEWS and LUMPS.  |
| SnowUse  | R                 | Determines whether the snow part of the model runs.   |   |
|  |                   | Value   | Comments  |
|  |                   | 0   | Snow calculations are <b>not</b> performed.   |
|  |                   | 1   | Snow calculations are performed.  |
| SOLWEIGUse   | R                 | Determines whether a high resolution radiation model to calculate mean radiant temperate should be used (SOLWEIG). NOTE: this option will considerably slow down the model since SOLWEIG is a 2D model. |   |
|  |                   | Value   | Comments  |
|  |                   | 0   | SOLWEIG calculations are <b>not</b> performed.  |
|  |                   | 1   | SOLWEIG calculations are performed. A grid of mean radiant temperature (Tmrt) is calculated based on high resolution digital surface models.  |
| NetRadiationMethod<br>(previously<br>NetRadiationChoice) | R                 | Determines method for calculation of radiation fluxes.  |   |
|  |                   | Value   | Comments  |
|  |                   | 0   | Uses observed values of Q* supplied in meteorological forcing file.   |
|  |                   | 1   | <ul style="list-style-type: none"><li>▪ Q* modelled with L↓ observations supplied in meteorological forcing file.</li><li>▪ Zenith angle <b>not</b> accounted for in albedo calculation.</li></ul>  |
|  |                   | 2   | <ul style="list-style-type: none"><li>▪ Q* modelled with L↓ modelled using cloud cover fraction supplied in meteorological forcing file (Loridan et al. 2011<sup>[5]</sup>).</li><li>▪ Zenith angle <b>not</b> accounted for in albedo calculation.</li></ul>                           |

|                             |          |  |  |

|   |   |   |  |  |
|---|---|---|--|--|
| SuppressWarnings                                | O | 0   | ■ The warnings.txt file is written. This is the default option.  |  |
|   |   | 1   | ■ No warnings.txt file is written. May be useful for large model runs as this file can grow large.   |  |
| Time-related options                            |   |   |  |  |
| Tstep   | R | Specifies the model time step [s]. A value of 300 s (5 min) is strongly recommended. The time step cannot be less than 1 min or greater than 10 min, and must be a whole number of minutes that divide into an hour (i.e. options are 1, 2, 3, 4, 5, 6, 10 min or 60, 120, 180, 240, 300, 360, 600 s).  |  |  |
| ResolutionFilesIn                               | R | Specifies the resolution of the input files [s] which SUEWS will disaggregate to the model time step. 1800 s for 30 min or 3600 s for 60 min are recommended. (N.B. if ResolutionFilesIn is not provided, SUEWS assumes ResolutionFilesIn = Tstep.)   |  |  |
| ResolutionFilesInESTM                           | O | Specifies the resolution of the ESTM input files [s] which SUEWS will disaggregate to the model time step.  |  |  |
| ResolutionFilesOut                              | R | Specifies the resolution of the output files [s]. 1800 s for 30 min or 3600 s for 60 min are recommended.   |  |  |
| Options related to disaggregation of input data |   |   |  |  |
| DisaggMethod                                    | O | Specifies how meteorological variables in the input file (except rain and snow) are disaggregated to the model time step. Wind direction is not currently downscaled so non -999 values will cause an error.  |  |  |
|   |   | Value   | Comments   |  |
|   |   | 1   | Linear downscaling of averages for all variables, additional zenith check is used for Kdown. This is the default option.   |  |
|   |   | 2   | Linear downscaling of instantaneous values for all variables, additional zenith check is used for Kdown.   |  |
|   |   | 3   | WFDEI setting: average Kdown (with additional zenith check); instantaneous for Tair, RH, pres and U. (N.B. WFDEI actually provides Q not RH)   |  |
| KdownZen  | O | Can be used to switch off zenith checking in Kdown disaggregation. Note that the zenith calculation requires location information obtained from SUEWS_SiteSelect.txt. If a single met file is used for all grids, the zenith is calculated for the first grid and the disaggregated data is then applied for all grids.                       |  |  |
|   |   | Value   | Comments   |  |
|   |   | 0   | No zenith angle check is applied.  |  |
|   |   | 1   | Disaggregated Kdown is set to zero when zenith angle exceeds 90 degrees (i.e. sun below horizon) and redistributed over the day. This is the default option.                           |  |
| RainDisaggMethod                                | O | Specifies how rain in the meteorological forcing file are disaggregated to the model time step. If present in the original met forcing file, snow is currently disaggregated in the same way as rainfall.   |  |  |
|   |   | Value   | Comments   |  |
|   |   | 100   | Rainfall is evenly distributed among all subintervals in a rainy interval. This is the default option.   |  |
|   |   | 101   | Rainfall is evenly distributed among among RainAmongN subintervals in a rainy interval – also requires RainAmongN to be set.   |  |
|   |   | 102   | Rainfall is evenly distributed among among RainAmongN subintervals in a rainy interval for different intensity bins – also requires MultRainAmongN and MultRainAmongNUpperI to be set. |  |
| RainAmongN                                      | O | Specifies the number of subintervals (of length tt) over which to distribute rainfall in each interval (of length TT). Must be an integer value. Use with RainDisaggMethod = 101.   |  |  |
| MultRainAmongN                                  | O | Specifies the number of subintervals (of length tt) over which to distribute rainfall in each interval (of length TT) for up to 5 intensity bins. Must take integer values. Use with RainDisaggMethod = 102.<br>e.g. MultRainAmongN(1) = 5, MultRainAmongN(2) = 8, MultRainAmongN(3) = 12   |  |  |
| MultRainAmongNUpperI                            | O | Specifies upper limit for each intensity bin to apply MultRainAmongN. Any intensities above the highest specified intensity will use the last MultRainAmongN value and write a warning to warnings.txt. Use with RainDisaggMethod = 102.<br>e.g. MultRainAmongNUpperI(1) = 0.5, MultRainAmongNUpperI(2) = 2.0, MultRainAmongNUpperI(3) = 50.0 |  |  |
| DisaggMethodESTM                                | O | Specifies how ESTM-related temperatures in the input file are disaggregated to the model time step.   |  |  |
|   |   | Value   | Comments   |  |
|   |   | 1   | Linear downscaling of averages.  |  |

|                               |          |   |  |
|-------------------------------|----------|---|--|
|                               |          | 2   | Linear downscaling of instantaneous values.  |
| <i>netCDF-related options</i> |          |   |  |
| <b>ncMode</b>                 | <b>O</b> | <b>Determine if the output files should be written in netCDF format.</b>                  |  |
|                               |          | Value   | Comments   |

|                               |          | 1   | <ul style="list-style-type: none"> <li>Output files will be written in netCDF format (i.e., .nc).</li> </ul> |
| <b>nRow</b>                   | <b>O</b> | <b>Number of rows (e.g., 36) in the output layout (only applicable when ncMode=1).</b>    |  |
| <b>nCol</b>                   | <b>O</b> | <b>Number of columns (e.g., 47) in the output layout (only applicable when ncMode=1).</b> |  |

### SUEWS\_v2017a\_SiteInfo.xlsm

The following text files provide SUEWS with information about the study area. These text files are stored as worksheets in **SUEWS\_v2017a\_SiteInfo.xlsm** and can be either edited using Excel and then generated using the macro, or edited directly (see Data Entry).

| Use | Column  |
|-----|---|
| MU  | Parameters which must be supplied and must be specific for the site/grid being run.   |
| MD  | Parameters which must be supplied and must be specific for the site/grid being run (but default values may be ok if these values are not known specifically for the site).  |
| O   | Parameters that are optional, depending on the model settings in RunControl. Set any parameters that are not used/not known to '-999'.  |
| L   | Codes that are used to link between the input files. These codes are required but their values are completely arbitrary, providing that they link the input files in the correct way. The user should choose these codes, bearing in mind that the codes they match up with in column 1 of the corresponding input file must be unique within that file. Codes must be integers. Note that the codes must match up with column 1 of the corresponding input file, even if those parameters are not used (in which case set all columns except column 1 to '-999' in the corresponding input file), otherwise the model run will fail. |

### SUEWS\_SiteSelect.txt

For each year and each grid, site specific surface cover information and other input parameters is provided to SUEWS by **SUEWS\_SiteSelect.txt**. The model currently requires a new row for each year of the model run. All rows in this file (before the two rows of '-9') will be read by the model and run. In this file the **column order is important**. '!' can be used to indicate comments in the file. Comments are not read by the programme so they can be used by the user to provide notes for their interpretation of the contents. This is strongly recommended.

| No. | Use | Column name | Example | Description   |
|-----|-----|-------------|---------|---|
| 1   | MU  | Grid        | 1       | <p>Grid number (any integer 0-2,147,483,647 (largest 4-byte integer)) identifying the current grid.</p> <ul style="list-style-type: none"> <li>Grid numbers do not need to be consecutive and do not need to start at a particular value.</li> <li>Each grid must have a unique grid number.</li> <li>All grids must be present for all years.</li> <li>These grid numbers are referred to in GridConnections (columns 64-79) (<b>N.B. GridConnections not currently implemented!</b>)</li> </ul> <p>The two last lines in this column must read '-9' to indicate that the last lines have been reached (using two lines allows differences in computer file savings to be dealt with).</p> |
| 2   | MU  | Year        | 2011    | <p>Year [YYYY]</p> <p>Years must be continuous. If running multiple years, ensure the rows in SiteSelect.txt are arranged so that all grids for a particular year appear on consecutive lines (rather than grouping all years together for a particular grid).</p>  |
| 3   | MU  | StartDLS    | 86      | <p>Start of the day light savings [DOY]</p> <p>See section on Day Light Savings.</p>  |
| 4   | MU  | EndDLS      | 303     | <p>End of the day light savings [DOY]</p> <p>See section on Day Light Savings.</p>  |
| 5   | MU  | lat         | 60.00   | <p>Latitude for the centre of the grid [decimal degrees]</p> <ul style="list-style-type: none"> <li>Use coordinate system WGS84.</li> <li>Positive values are northern hemisphere (negative southern hemisphere).</li> <li>Used in radiation calculations.</li> <li>Note, if the total modelled area is small the latitude and longitude could be the same for each grid but small differences in radiation will not be determined. If you are defining the latitude and longitude differently between grids make certain that you provide enough decimal places.</li> </ul>  |
|     |     |             |         | Longitude for the centre of the grid [decimal degrees]  |

|    |    |             |        |  |
|----|----|-------------|--------|--|
| 6  | MU | lng         | -18.20 | <ul style="list-style-type: none"> <li>■ Use coordinate system WGS84.</li> <li>■ For compatibility with GIS, negative values are to the west, positive values are to the east (e.g. Vancouver = -123.12; Shanghai = 121.47) <b>Note this is a change of sign convention between v2016a and v2017a</b></li> <li>■ See latitude for more details.</li> </ul> |
| 7  | MU | Timezone    | 0      | Time zone [h] for site relative to UTC (east is positive). This should be set according to the times given in the meteorological forcing file(s).  |
| 8  | MU | SurfaceArea | 75.3   | Area of the grid [ha].   |
| 9  | MU | Alt         | 25.0   | Altitude [m]<br>Mean topographic height above sea-level. <ul style="list-style-type: none"> <li>■ Used for both the radiation and water flow between grids. (<b>N.B. water flow between grids not currently implemented.</b>)</li> </ul>   |
| 10 | MU | z           | 20.5   | Height [m] of the meteorological forcing data. The most important height is that of the wind speed measurement. <ul style="list-style-type: none"> <li>■ z must be greater than the displacement height.</li> <li>■ Forcing data should be representative of the local-scale, i.e. above the height of the roughness elements.</li> </ul>                  |
| 11 | MD | id          | 1      | Day [DOY]<br>Not used: set to 1 in this version.   |
| 12 | MD | ih          | 0      | Hour [H]<br>Not used: set to 0 in this version.  |
| 13 | MD | imin        | 0      | Minute [M]<br>Not used: set to 0 in this version.  |
| 14 | MU | Fr_Paved    | 0.20   | Surface cover fraction of paved surfaces [-]<br>Areal cover fraction of paved surfaces (roads, pavements, car parks). e.g. 20% of the grid is covered with paved surfaces. <ul style="list-style-type: none"> <li>■ <b>Columns 14 to 20 must sum to 1.</b></li> </ul>  |
| 15 | MU | Fr_Bldgs    | 0.20   | Surface cover fraction of buildings [-]  |
| 16 | MU | Fr_EveTr    | 0.10   | Surface cover fraction of evergreen trees and shrubs [-]   |
| 17 | MU | Fr_DecTr    | 0.10   | Surface cover fraction of deciduous trees and shrubs [-]   |
| 18 | MU | Fr_Grass    | 0.30   | Surface cover fraction of grass [-]  |
| 19 | MU | Fr_Bsoil    | 0.05   | Surface cover fraction of bare soil or unmanaged land [-]  |
| 20 | MU | Fr_Water    | 0.05   | Surface cover fraction of open water [-]<br>(e.g. river, lakes, ponds, swimming pools)   |
| 21 | MU | IrrFr_EveTr | 0.50   | Fraction of evergreen trees that are irrigated [-]<br>e.g. 50% of the evergreen trees/shrubs are irrigated   |
| 22 | MU | IrrFr_DecTr | 0.20   | Fraction of deciduous trees that are irrigated [-]   |
| 23 | MU | IrrFr_Grass | 0.70   | Fraction of grass that is irrigated [-]  |
| 24 | MU | H_Bldgs     | 10     | Mean building height [m]   |
| 25 | MU | H_EveTr     | 15     | Mean height of evergreen trees [m]   |
| 26 | MU | H_DecTr     | 15     | Mean height of deciduous trees [m]   |
| 27 | O  | z0          | 0.6    | Roughness length for momentum [m]<br>Value supplied here is used if RoughLenMomMethod = 1 in RunControl.nml; otherwise set to '-999' and a value will be calculated by the model (RoughLenMomMethod = 2, 3).   |
| 28 | O  | zd          | 1.5    | Zero-plane displacement [m]<br>Value supplied here is used if RoughLenMomMethod = 1 in RunControl.nml; otherwise set to '-999' and a value will be calculated by the model (RoughLenMomMethod = 2, 3).   |
| 29 | O  | FAI_Bldgs   | 0.1    | Frontal area index for buildings [-]<br>Required if RoughLenMomMethod = 3 in RunControl.nml.   |
| 30 | O  | FAI_EveTr   | 0.2    | Frontal area index for evergreen trees [-]   |

|    |    |                |      |   |
|----|----|----------------|------|---|
|    |    |                |      | Required if RoughLenMomMethod = 3 in RunControl.nml.  |
| 31 | O  | FAI_DecTr      | 0.2  | Frontal area index for deciduous trees [-]<br>Required if RoughLenMomMethod = 3 in RunControl.nml.  |
| 32 | O  | PopDensDay     | 30.7 | Daytime population density (i.e. workers, tourists) [people ha <sup>-1</sup> ]<br>Population density is required if AnthroHeatMethod = 2 in RunControl.nml. The model will use the average of daytime and night-time population densities, unless only one is provided. If daytime population density is unknown, set to -999.  |
| 33 | O  | PopDensNight   | 10.2 | Night-time population density (i.e. residents) [people ha <sup>-1</sup> ]<br>Population density is required if AnthroHeatMethod = 2 in RunControl.nml. The model will use the average of daytime and night-time population densities, unless only one is provided. If night-time population density is unknown, set to -999.  |
| 34 | O  | TrafficRate    |      | Traffic rate [veh km m <sup>-2</sup> s <sup>-1</sup> ]<br>Can be used for CO2 flux calculation. <b>Do not use in v2017a - set to -999</b>   |
| 35 | O  | BuildEnergyUse |      | Building energy use [W m <sup>-2</sup> ]<br>Can be used for CO2 flux calculation. <b>Do not use in v2017a - set to -999</b>   |
| 36 | L  | Code_Paved     | 331  | Code for Paved surface characteristics<br>Provides the link to column 1 of SUEWS_NonVeg.txt, which contains the attributes describing paved areas in this grid for this year. Value of integer is arbitrary but must match code specified in column 1 of SUEWS_NonVeg.txt. e.g. 331 means use the characteristics specified in the row of input file SUEWS_NonVeg.txt which has 331 in column 1 (Code). |
| 37 | L  | Code_Bldgs     | 332  | Code for Bldgs surface characteristics<br>Provides the link to column 1 of SUEWS_NonVeg.txt, which contains the attributes describing buildings in this grid for this year. Value of integer is arbitrary but must match code specified in column 1 of SUEWS_NonVeg.txt.  |
| 38 | L  | Code_EveTr     | 331  | Code for EveTr surface characteristics<br>Provides the link to column 1 of SUEWS_Veg.txt, which contains the attributes describing evergreen trees and shrubs in this grid for this year. Value of integer is arbitrary but must match code specified in column 1 of SUEWS_Veg.txt.   |
| 39 | L  | Code_DecTr     | 332  | Code for DecTr surface characteristics<br>Provides the link to column 1 of SUEWS_Veg.txt, which contains the attributes describing deciduous trees and shrubs in this grid for this year. Value of integer is arbitrary but must match code specified in column 1 of SUEWS_Veg.txt.   |
| 40 | L  | Code_Grass     | 333  | Code for Grass surface characteristics<br>Provides the link to column 1 of SUEWS_Veg.txt, which contains the attributes describing grass surfaces in this grid for this year. Value of integer is arbitrary but must match code specified in column 1 of SUEWS_Veg.txt.   |
| 41 | L  | Code_Bsoil     | 333  | Code for BSoil surface characteristics<br>Provides the link to column 1 of SUEWS_NonVeg.txt, which contains the attributes describing bare soil in this grid for this year. Value of integer is arbitrary but must match code specified in column 1 of SUEWS_NonVeg.txt.  |
| 42 | L  | Code_Water     | 331  | Code for Water surface characteristics<br>Provides the link to column 1 of SUEWS_Water.txt, which contains the attributes describing open water in this grid for this year. Value of integer is arbitrary but must match code specified in column 1 of SUEWS_Water.txt.   |
| 43 | MD | LUMPS_DrRate   | 0.25 | Drainage rate of bucket for LUMPS [mm h <sup>-1</sup> ]<br>Used for LUMPS surface wetness control. Default recommended value of 0.25 mm h <sup>-1</sup> from Loridan et al. (2011) <sup>[5]</sup> .   |
| 44 | MD | LUMPS_Cover    | 1    | Limit when surface totally covered with water [mm]<br>Used for LUMPS surface wetness control. Default recommended value of 1 mm from Loridan et al. (2011) <sup>[5]</sup> .   |
| 45 | MD | LUMPS_MaxRes   | 10   | Maximum water bucket reservoir [mm]<br>Used for LUMPS surface wetness control. Default recommended value of 10 mm from Loridan et al. (2011) <sup>[5]</sup> .   |
|    |    |                |      | Atmospheric transmissivity for NARP [-]   |

|    |    |                    |     |  |
|----|----|--------------------|-----|--|
| 46 | MD | NARP_Trans         | 1   | Value must in the range 0-1. Default recommended value of 1.   |
| 47 | L  | CondCode           | 33  | Code for surface conductance parameters<br><br>Provides the link to column 1 of SUEWS_Conductance.txt, which contains the parameters for the Jarvis (1976) parameterisation of surface conductance. Value of integer is arbitrary but must match code specified in column 1 of SUEWS_Conductance.txt. e.g. 33 means use the characteristics specified in the row of input file SUEWS_Conductance.txt which has 33 in column 1 (Code).  |
| 48 | L  | SnowCode           | 33  | Code for snow surface characteristics<br><br>Provides the link to column 1 of SUEWS_Snow.txt, which contains the attributes describing snow surfaces in this grid for this year. Value of integer is arbitrary but must match code specified in column 1 of SUEWS_Snow.txt.  |
| 49 | L  | SnowClearingProfWD | 1   | Code for snow clearing profile (weekdays)<br><br>Provides the link to column 1 of SUEWS_Profiles.txt. Value of integer is arbitrary but must match code specified in column 1 of SUEWS_Profiles.txt. e.g. 1 means use the characteristics specified in the row of input file SUEWS_Profiles.txt which has 1 in column 1 (Code).  |
| 50 | L  | SnowClearingProfWE | 1   | Code for snow clearing profile (weekends)<br><br>Provides the link to column 1 of SUEWS_Profiles.txt. Value of integer is arbitrary but must match code specified in column 1 of SUEWS_Profiles.txt. e.g. 1 means use the characteristics specified in the row of input file SUEWS_Profiles.txt which has 1 in column 1 (Code). Providing the same code for SnowClearingProfWD and SnowClearingProfWE would link to the same row in SUEWS_Profiles.txt, i.e. the same profile would be used for weekdays and weekends. |
| 51 | L  | AnthropogenicCode  | 33  | Code for modelling anthropogenic heat flux<br><br>Provides the link to column 1 of SUEWS_AnthropogenicHeat.txt, which contains the model coefficients for estimation of the anthropogenic heat flux (used if AnthroHeatChoice = 1, 2 in RunControl.nml). Value of integer is arbitrary but must match code specified in column 1 of SUEWS_AnthropogenicHeat.txt.   |
| 52 | L  | EnergyUseProfWD    | 333 | Code for energy use profile (weekdays)<br><br>Provides the link to column 1 of SUEWS_Profiles.txt. Look the codes Value of integer is arbitrary but must match code specified in column 1 of SUEWS_Profiles.txt.   |
| 53 | L  | EnergyUseProfWE    | 334 | Code for energy use profile (weekends)<br><br>Provides the link to column 1 of SUEWS_Profiles.txt. Value of integer is arbitrary but must match code specified in column 1 of SUEWS_Profiles.txt.  |
| 54 | L  | ActivityProfWD     | 333 | Code for human activity profile (weekdays)<br><br>Provides the link to column 1 of SUEWS_Profiles.txt. Look the codes Value of integer is arbitrary but must match code specified in column 1 of SUEWS_Profiles.txt. Used for CO2 flux calculation - <b>not used in v2017a</b>   |
| 55 | L  | ActivityProfWE     | 333 | Code for human activity profile (weekends)<br><br>Provides the link to column 1 of SUEWS_Profiles.txt. Look the codes Value of integer is arbitrary but must match code specified in column 1 of SUEWS_Profiles.txt. Used for CO2 flux calculation - <b>not used in v2017a</b>   |
| 56 | L  | IrrigationCode     | 33  | Code for modelling irrigation<br><br>Provides the link to column 1 of SUEWS_Irrigation.txt, which contains the model coefficients for estimation of the water use (used if WU_Choice = 0 in RunControl.nml). Value of integer is arbitrary but must match code specified in column 1 of SUEWS_Irrigation.txt.  |
| 57 | L  | WaterUseProfManuWD | 335 | Code for water use profile (manual irrigation, weekdays)<br><br>Provides the link to column 1 of SUEWS_Profiles.txt. Value of integer is arbitrary but must match code specified in column 1 of SUEWS_Profiles.txt.  |
| 58 | L  | WaterUseProfManuWE | 336 | Code for water use profile (manual irrigation, weekends)<br><br>Provides the link to column 1 of SUEWS_Profiles.txt. Value of integer is arbitrary but must match code specified in column 1 of SUEWS_Profiles.txt.  |
| 59 | L  | WaterUseProfAutoWD | 337 | Code for water use profile (automatic irrigation, weekdays)<br><br>Provides the link to column 1 of SUEWS_Profiles.txt. Value of integer is arbitrary but must match code specified in column 1 of SUEWS_Profiles.txt.   |

|    |       |                     |     |  |
|----|-------|---------------------|-----|--|
| 60 | L     | WaterUseProfAutoWE  | 338 | Code for water use profile (automatic irrigation, weekends)<br><br>Provides the link to column 1 of SUEWS_Profiles.txt. Value of integer is arbitrary but must match code specified in column 1 of SUEWS_Profiles.txt.   |
| 61 | MD    | FlowChange          | 0   | Difference in input and output flows for water surface [mm h <sup>-1</sup> ]<br><br>Used to indicate river or stream flow through the grid. <b>Currently not fully tested!</b>   |
| 62 | MD,MU | RunoffToWater       | 0.1 | Fraction of above-ground runoff flowing to water surface during flooding [-]<br><br>Value must be in the range 0-1. Fraction of above-ground runoff that can flow to the water surface in the case of flooding.  |
| 63 | MD,MU | PipeCapacity        | 100 | Storage capacity of pipes [mm]<br><br>Runoff amounting to less than the value specified here is assumed to be removed by pipes.  |
| 64 | MD,MU | GridConnection1of8  | 2   | Number of the grid where water can flow to [-]<br><br><ul style="list-style-type: none"> <li>The next 8 pairs of columns specify the water flow between grids.</li> <li>The first column of each pair specifies the grid that the water flows to (from the current grid, column 1); the second column of each pair specifies the fraction of water that flow to that grid.</li> <li>The fraction (i.e. amount) of water transferred may be estimated based on elevation, the length of connecting surface between grids, presence of walls, etc.</li> <li>Water cannot flow from the current grid to the same grid, so the grid number here must be different to the grid number in column 1. Water can flow to a maximum of 8 other grids.</li> <li>If there is no water flow between grids, or a single grid is run, set to 0.</li> <li>See section on Grid Connections</li> </ul> <b>Not currently implemented!</b> |
| 65 | MD,MU | Fraction1of8        | 0.2 | Fraction of water that can flow to the grid specified in previous column [-]   |
| 66 | MD,MU | GridConnection2of8  | 0   | Number of the grid where water can flow to   |

**Day Light Savings (DLS)**

The dates for DLS normally vary each year and country as they are often associated with a specific set of Sunday mornings at the beginning of summer and autumn. Note it is important to remember leap years. You can check <http://www.timeanddate.com/time/dst/> for your city.

If DLS does not occur give a start and end day immediately after it. Make certain the dummy dates are correct for the hemisphere:

```

for northern hemisphere, use: 180 181
for southern hemisphere, use: 365 1

```

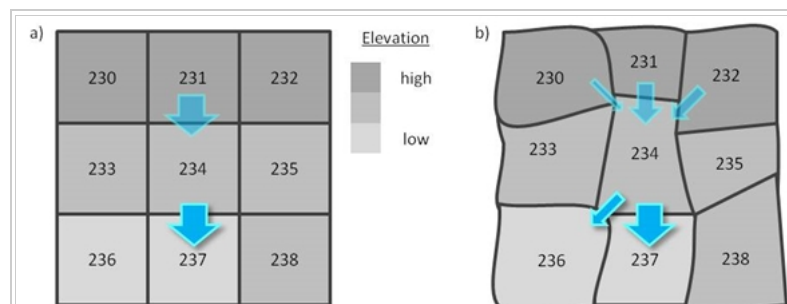

| Example:   | Year | start of daylight savings | end of daylight savings |
|--|------|---------------------------|-------------------------|
| when running multiple years (in this case 2008 and 2009 in Canada) | 2008 | 170                       | 240                     |
|  | 2009 | 172                       | 242                     |

**Grid Connections (water flow between grids)**

**N.B. not currently implemented** - columns 64-79 of SUEWS\_SiteSelect.txt can be set to zero.

This section gives an example of water flow between grids, calculated based on the relative elevation of the grids and length of the connecting surface between adjacent grids. For the square grids in the figure, water flow is assumed to be zero between diagonally adjacent grids, as the length of connecting surface linking the grids is very small. Model grids need not be square or the same size.

The table gives example values for the grid connections part of SUEWS\_SiteSelect.txt for the grids shown in the figure. For each row, only water flowing out of the current grid is entered (e.g. water flows from 234 to 236 and 237, with a larger proportion of water flowing to 237 because of the greater length of connecting surface between 234 and 237 than between 234 and 236. No water is assumed to flow between 234 and 233 or 235 because there is no elevation difference between these grids. Grids 234 and 238 are at the same elevation and only connect at a point, so no water flows between them. Water enters grid 234 from grids 230, 231 and 232 as these are more elevated.

Example grid connections showing water flow between grids. Arrows indicate the water flow in to and out of grid 234, but note that only only water flowing out of each grid is entered in SUEWS\_SiteSelect.txt.

| Grid | GridConnection 1to8 | Fraction1to8 | GridConnection 2to8 | Fraction2to8 | GridConnection 3to8 | Fraction3to8 | GridConnection 4to8 | Fraction4to8 | GridConnection 5to8 | Fraction5to8 | GridConnection 6to8 | Fraction6to8 | GridConnection 7to8 | Fraction7to8 | GridConnection 8to8 | Fraction8to8 |

Example values for the grid connections part of SUEWS\_SiteSelect.txt for the grids.

### SUEWS\_NonVeg.txt

SUEWS\_NonVeg.txt specifies the characteristics for the non-vegetated surface cover types (Paved, Bldgs, BSoil) by linking codes in column 1 of SUEWS\_NonVeg.txt to the codes specified in SUEWS\_SiteSelect.txt (Code\_Paved, Code\_Bldgs, Code\_BSoil). Each row should correspond to a particular surface type. For suggestions on how to complete this table, see: Typical Values ([http://urban-climate.net/umep/TypicalValues#Typical\\_Values](http://urban-climate.net/umep/TypicalValues#Typical_Values)).

| No. | Use | Column name | Example           | Description   |

### SUEWS\_Veg.txt

SUEWS\_Veg.txt specifies the characteristics for the vegetated surface cover types (EveTr, DecTr, Grass) by linking codes in column 1 of SUEWS\_Veg.txt to the codes specified in SUEWS\_SiteSelect.txt (Code\_EveTr, Code\_DecTr, Code\_Grass). Each row should correspond to a particular surface type. For suggestions on how to complete this table, see: Typical Values ([http://urban-climate.net/umep/TypicalValues#Typical\\_Values](http://urban-climate.net/umep/TypicalValues#Typical_Values)).

| No. | Use | Column name | Example           | Description  |

| 17 | MD | OHMThresh_SW      | 10   | Temperature threshold determining whether summer/winter OHM coefficients are applied [deg C]<br>If 5-day running mean air temperature is greater than or equal to this threshold, OHM coefficients for summertime are applied; otherwise coefficients for wintertime are applied.   |
| 18 | MD | OHMThresh_WD      | 0.9  | Soil moisture threshold determining whether wet/dry OHM coefficients are applied [-]<br>If soil moisture (as a proportion of maximum soil moisture capacity) exceeds this threshold for bare soil and vegetated surfaces, OHM coefficients for wet conditions are applied; otherwise coefficients for dry coefficients are applied. Note that OHM coefficients for wet conditions are applied if the surface is wet. <b>Not actually used for water</b> |

|    |    |          |  |  |
|----|----|----------|--|--|
|    |    |          |  | <b>surface (as no soil surface beneath).</b>   |
| 19 | L  | ESTMCode |  | Code for ESTM coefficients to use for this surface.<br>Links to SUEWS_ESTMCoefficients.txt. Value of integer is arbitrary but must match code specified in column 1 of SUEWS_ESTMCoefficients.txt. |
| 20 | MU | AnOHM_Cp |  | Volumetric heat capacity for this surface to use in AnOHM [ $\text{J m}^{-3}$ ]  |
| 21 | MU | AnOHM_Kk |  | Thermal conductivity for this surface to use in AnOHM [ $\text{W m K}^{-1}$ ]  |
| 22 | MU | AnOHM_Ch |  | Bulk transfer coefficient for this surface to use in AnOHM [-]   |

### SUEWS\_Snow.txt

SUEWS\_Snow.txt specifies the characteristics for snow surfaces when SnowUse=1 in RunControl.nml. If the snow part of the model is not run, fill this table with '-999' except for the first (Code) column and set SnowUse=0 in RunControl.nml. For a detailed description of the variables, see Järvi et al. (2014)<sup>[15]</sup>. *In the current release SnowUse should be set to 0.*

| No. | Use | Column name       | Example | Description  |
|-----|-----|-------------------|---------|--|
| 1   | L   | Code              | 331     | Code linking to SUEWS_SiteSelect.txt for snow surfaces (SnowCode).<br>Value of integer is arbitrary but must match code specified in SUEWS_SiteSelect.txt.   |
| 2   | MU  | RadMeltFactor     | 0.0016  | Hourly radiation melt factor of snow [ $\text{mm W}^{-1} \text{h}^{-1}$ ]  |
| 3   | MU  | TempMeltFactor    | 0.07    | Hourly temperature melt factor of snow [ $\text{mm } ^\circ\text{C}^{-1} \text{h}^{-1}$ ] (In previous model version, this parameter was 0.12)   |
| 4   | MU  | AlbedoMin         | 0-1     | Minimum snow albedo [-]<br><b>Example values [-]</b><br>0.18 Järvi et al. (2014) <sup>[15]</sup>   |

### SUEWS\_Soil.txt

SUEWS\_Soil.txt specifies the characteristics of the sub-surface soil below each of the non-water surface types (Paved, Bldgs, EveTr, DecTr, Grass, BSoil). The model does not have a soil store below the water surfaces. Note that these sub-surface soil stores are different to the bare soil/unmanaged surface cover type. Each of the non-water surface types need to link to soil characteristics specified here. If the soil characteristics are assumed to be the same for all surface types, use a single code value to link the characteristics here with the SoilTypeCode columns in SUEWS\_NonVeg.txt and SUEWS\_Veg.txt.

Soil moisture can either be provided using observational data in the met forcing file (smd\_choice = 1 or 2 in RunControl.nml) and providing some metadata information here (OBS\_ columns), or modelled by SUEWS (smd\_choice = 0 in RunControl.nml). - **Note, the option to use observational data is not operational in the current release!**

| No. | Use | Column name      | Example | Description  |
|-----|-----|------------------|---------|--|
| 1   | L   | Code             | 331     | <p>Code linking to the SoilTypeCode column in SUEWS_NonVeg.txt (for Paved, Bldgs and BSoil surfaces) and SUEWS_Veg.txt (for EveTr, DecTr and Grass surfaces).</p> <p>Value of integer is arbitrary but must match code specified in SUEWS_SiteSelect.txt.</p>  |

**SUEWS\_Conductance.txt**

SUEWS\_Conductance.txt contains the parameters needed for the Jarvis (1976) surface conductance model used in the modelling of evaporation in SUEWS. These values should **not** be changed independently of each other. The suggested values below have been derived using datasets for Los Angeles and Vancouver (see Järvi et al. (2011)<sup>[1]</sup>) and should be used with **gsModel=1**. An alternative formulation (gsModel=2) uses slightly different functional forms and different coefficients (with different units).

| No. | Use | Column name | Example  | Description  |
|-----|-----|-------------|----------|--|
| 1   | L   | Code        |          | Code linking to the CondCode column in SUEWS_SiteSelect.txt.<br>Value of integer is arbitrary but must match code specified in SUEWS_SiteSelect.txt.   |

(2016)<sup>[2]</sup> <b>Recommended.</b></li> </ul> <b>The parameterisation specified here must match the coefficients specified in the other columns of SUEWS_Conductance.txt.</b> |

**SUEWS\_AnthropogenicHeat.txt**

SUEWS\_AnthropogenicHeatFlux.txt provides the parameters needed to model the anthropogenic heat flux using either the method of Järvi et al. (2011) based on heating and cooling degree days (AnthropHeatMethod = 2 in 4.1 RunControl.nml) or the method of Loridan et al. (2011) based on air temperature (AnthropHeatMethod = 1 in RunControl.nml). The sub-daily variation in anthropogenic heat flux is modelled according to the daily cycles specified in SUEWS\_Profiles.txt. Alternatively, if available, the anthropogenic heat flux can be provided in the met forcing file (and set AnthropHeatMethod = 0 in RunControl.nml), in which case all columns here except Code and BaseTHDD should be set to '-999'.

### SUEWS\_Irrigation.txt

SUEWS includes a simple model for external water use if observed data are not available. The model calculates daily water use from the mean daily air temperature, number of days since rain and fraction of irrigated area using automatic/manual irrigation. The sub-daily pattern of water use is modelled according to the daily cycles specified in SUEWS\_Profiles.txt.

Alternatively, if available, the external water use can be provided in the met forcing file (and set WaterUseMethod = 1 in RunControl.nml), in which case all columns here except Code should be set to '-999'.

| No. | Use | Column name      | Example | Description   |
|-----|-----|------------------|---------|---|
| 1   | L   | Code             |         | Code linking to [[#SUEWS_SiteSelect.txt SUEWS_SiteSelect.txt] for irrigation modelling (IrrigationCode).<br>Value of integer is arbitrary but must match codes specified in SUEWS_SiteSelect.txt. |

| 25  | MU  | DayWatPer(7)     | 0-1     | Fraction of properties using irrigation on Saturdays [0-1]  |

### SUEWS\_Profiles.txt

SUEWS\_Profiles.txt specifies the daily cycle of variables related to human behaviour (energy use, water use and snow clearing). Different profiles can be specified for weekdays and weekends. The profiles are provided at hourly resolution here; the model will then interpolate the hourly energy and water use profiles to the resolution of the model time step and normalize the values provided. Thus it does not matter whether columns 2-25 add up to, say 1, 24, or another number, because the model will handle this. Currently, the snow clearing profiles are not interpolated as these are effectively a switch (0 or 1).

If the anthropogenic heat flux and water use are specified in the met forcing file, the energy and water use profiles are not used.

Profiles are specified for the following

- Anthropogenic heat flux (weekday and weekend)
- Water use (weekday and weekend; manual and automatic irrigation)
- Snow removal (weekday and weekend)
- Human activity (weekday and weekend) - **not used in v2017a**.

| No.  | Use | Column name | Example | Description  |
|------|-----|-------------|---------|--|
| 1    | L   | Code        |         | Code linking to the following columns in SUEWS_SiteSelect.txt: <ul style="list-style-type: none"> <li>■ EnergyUseProfWD : Anthropogenic heat flux, weekdays</li> <li>■ EnergyUseProfWE : Anthropogenic heat flux, weekends</li> <li>■ WaterUseProfManuWD : Manual irrigation, weekdays</li> <li>■ WaterUseProfManuWE : Manual irrigation, weekends</li> <li>■ WaterUseProfAutoWD : Automatic irrigation, weekdays</li> <li>■ WaterUseProfAutoWE : Automatic irrigation, weekends</li> <li>■ SnowClearingProfWD : Snow clearing, weekdays</li> <li>■ SnowClearingProfWE : Snow clearing, weekends</li> <li>■ ActivityProfWD : Human activity, weekdays</li> <li>■ ActivityProfWE : Human activity, weekends</li> <li>■ Value of integer is arbitrary but must match codes specified in SUEWS_SiteSelect.txt.</li> </ul> |
| 2-25 | MU  | 0-23        |         | Multiplier for each hour of the day [-] for energy and water use.<br><br>For SnowClearing, set those hours to 1 when snow removal from paved and roof surface is allowed (0 otherwise) if the snow removal limits set in the SUEWS_NonVeg.txt (SnowLimRemove column) are exceeded.   |

**SUEWS\_WithinGridWaterDist.txt**

SUEWS\_WithinGridWaterDist.txt specifies the movement of water between surfaces within a grid/area. It allows impervious connectivity to be taken into account.

Each row corresponds to a surface type (linked by the Code in column 1 to the SiteSelect.txt columns: WithinGridPavedCode, WithinGridBldgsCode, ..., WithinGridWaterCode). Each column contains the fraction of water flowing from the surface type to each of the other surface types or to runoff or the sub-surface soil store.

Note:

- The sum of each row (excluding the Code) must equal 1.
- Water cannot flow from one surface to that same surface, so the diagonal elements should be zero.
- The row corresponding to the water surface should be zero, as there is currently no flow permitted from the water surface to other surfaces by the model.
- Currently water **cannot** go to both runoff and soil store (i.e. it must go to one or the other – runoff for impervious surfaces; soilstore for pervious surfaces).

In the table below, for example,

- all flow from paved surfaces goes to runoff;
- 90% of flow from buildings goes to runoff, with small amounts going to other surfaces (mostly paved surfaces as buildings are often surrounded by paved areas);
- all flow from vegetated and bare soil areas goes into the sub-surface soil store;
- the row corresponding to water contains zeros (as it is currently not used).

| 1    | 2       | 3       | 4       | 5       | 6       | 7       | 8       | 9        | 10          |         |
|------|---------|---------|---------|---------|---------|---------|---------|----------|-------------|---------|

**SUEWS\_OHMCoefficients.txt**

OHM, the Objective Hysteresis Model (Grimmond et al. 1991)<sup>[9]</sup> calculates the storage heat flux as a function of net all-wave radiation and surface characteristics.

- For each surface, OHM requires three model coefficients (a1, a2, a3). The three should be selected as a set.
- The **SUEWS\_OHMCoefficients.txt** file provides these coefficients for each surface type.
- A variety of values has been derived for different materials and can be found in the literature (see: Typical Values ([http://urban-climate.net/umep/TypicalValues#OHM\\_Coefficients%7C](http://urban-climate.net/umep/TypicalValues#OHM_Coefficients%7C))).
- Coefficients can be changed depending on:
  1. surface wetness state (wet/dry) based on the calculated surface wetness state and soil moisture.
  2. season (summer/winter) based on a 5-day running mean air temperature.
- To use the same coefficients irrespective of wet/dry and summer/winter conditions, use the same code for all four OHM columns (OHMCode\_SummerWet, OHMCode\_SummerDry, OHMCode\_WinterWet and OHMCode\_WinterDry).

Note, **AnOHM** does not use the coefficients specified in SUEWS\_OHMCoefficients.txt but instead requires three parameters to be specified for each surface type (including snow): heat capacity, thermal conductivity and bulk transfer coefficient. These are specified in SUEWS\_NonVeg.txt, SUEWS\_Veg.txt, SUEWS\_Water.txt and SUEWS\_Snow.txt. No additional files are required for AnOHM.

**Note AnOHM is under development in v2017a and should not be used!**

| No. | Use | Column name | Example | Description   |
|-----|-----|-------------|---------|---|
| 1   | L   | Code        | 331     | Code linking to the OHMCode_SummerWet, OHMCode_SummerDry, OHMCode_WinterWet and OHMCode_WinterDry columns in SUEWS_NonVeg.txt, SUEWS_Veg.txt, SUEWS_Water.txt and SUEWS_Snow.txt files.<br>Value of integer is arbitrary but must match code specified in SUEWS_SiteSelect.txt. |
| 2   | MU  | a1          |         | Coefficient for Q* term [-]   |
| 3   | MU  | a2          |         | Coefficient for dQ*/dt term [h]   |
| 4   | MU  | a3          |         | Constant term [W m <sup>-2</sup> ]  |

**SUEWS\_ESTMCoefficients.txt**

**Note ESTM is under development in v2017a and should not be used!**

The Element Surface Temperature Method (ESTM) (Offerle et al., 2005) calculates the net storage heat flux from surface temperatures. In the method the three-dimensional urban volume is reduced to four 1-d elements (i.e. building roofs, walls, and internal mass and ground (road, vegetation, etc)). The storage heat flux is calculated from the heat conduction through the different elements. For the inside surfaces of the roof and walls, and both surfaces for the internal mass (ceilings/floors, internal walls), the surface temperature of the element is determined by setting the conductive heat transfer out of (in to) the surface equal to the radiative and convective heat losses (gains). Each element (roof, wall, internal element and ground) can have maximum five layers and each layer has three parameters tied to it: thickness (x), thermal conductivity (k), volumetric heat capacity (rhoCp).

If ESTM is used (QSchoice=4), the files SUEWS\_ESTMCoefficients.txt, ESTMinput.nml and SS\_YYYY\_ESTM\_Ts\_data\_tt.txt should be prepared.

SUEWS\_ESTMCoefficients.txt contains the parameters for the layers of each of the elements (roofs, wall, ground, internal mass).

- If less than five layers are used, the parameters for unused layers should be set to -999.
- The ESTM coefficients with the prefix *Surf\_* must be specified for each surface type (plus snow) but the *Wall\_* and *Internal\_* variables apply to the building surfaces only.
- For each grid, one set of ESTM coefficients must be specified for each surface type; for paved and building surfaces it is possible to specify up to three and five sets of coefficients per grid (e.g. to represent different building materials) using the relevant columns in SUEWS\_SiteSelect.txt. For the model to use these columns in site select, the ESTMCode column in SUEWS\_NonVeg.txt should be set to zero.

| No. | Use | Column name     | Example | Description  |
|-----|-----|-----------------|---------|--|
| 1   | L   | Code            | 331     | Code linking to the ESTMCode column in SUEWS_NonVeg.txt, SUEWS_Veg.txt, SUEWS_Water.txt and SUEWS_Snow.txt files. <ul style="list-style-type: none"> <li>■ For buildings and paved surfaces, <b>set to zero</b> if there is more than one ESTM class per grid and the codes and surface fractions specified in SUEWS_SiteSelect.txt will be used instead.</li> </ul> |
| 2   | MU  | Surf_thick1     | 0.2     | Thickness of the first layer [m] for roofs (building surfaces) and ground (all other surfaces)   |
| 3   | MU  | Surf_k1         | 0.5     | Thermal conductivity of the first layer [ $\text{W m}^{-1} \text{K}^{-1}$ ]  |

| 34  | MU  | Internal_rhoCp1 | -       | Volumetric heat capacity of the first layer [ $\text{J m}^{-3} \text{K}^{-1}$ ]  |
| 35  | O   | Internal_thick2 | -       | Thickness of the second layer [m] (if no second layer, set to -999.)   |
| 36  | O   | Internal_k2     | -       | Thermal conductivity of the second layer [ $\text{W m}^{-1} \text{K}^{-1}$ ]   |
| 37  | O   | Internal_rhoCp2 | -       | Volumetric heat capacity of the second layer [ $\text{J m}^{-3} \text{K}^{-1}$ ]   |
| 38  | O   | Internal_thick3 | -       | Thickness of the third layer [m] (if no third layer, set to -999.)   |
| 39  | O   | Internal_k3     | -       | Thermal conductivity of the third layer [ $\text{W m}^{-1} \text{K}^{-1}$ ]  |
| 40  | O   | Internal_rhoCp3 | -       | Volumetric heat capacity of the third layer [ $\text{J m}^{-3} \text{K}^{-1}$ ]  |
| 41  | O   | Internal_thick4 | -       | Thickness of the fourth layer [m] (if no fourth layer, set to -999.)   |
| 42  | O   | Internal_k4     | -       | Thermal conductivity of the fourth layer [ $\text{W m}^{-1} \text{K}^{-1}$ ]   |

|    |    |                     |   |   |
|----|----|---------------------|---|---|
| 43 | O  | Internal_rhoCp4     | - | Volumetric heat capacity of the fourth layer [ $\text{J m}^{-3} \text{K}^{-1}$ ]  |
| 44 | O  | Internal_thick5     | - | Thickness of the fifth layer [m] (if no fifth layer, set to -999.)  |
| 45 | O  | Internal_k5         | - | Thermal conductivity of the fifth layer [ $\text{W m}^{-1} \text{K}^{-1}$ ]   |
| 46 | O  | Internal_rhoCp5     | - | Volumetric heat capacity of the fifth layer [ $\text{J m}^{-3} \text{K}^{-1}$ ]   |
| 47 | MU | nroom               | - | Number of rooms per floor for building surfaces only  |
| 48 | MU | Internal_albedo     | - | Albedo of all internal elements for building surfaces only  |
| 49 | MU | Internal_emissivity | - | Emissivity of all internal elements for building surfaces only  |
| 50 | O  | Internal_CHwall     |   | Bulk transfer coefficient of internal wall [ $\text{W m}^{-2} \text{K}^{-1}$ ] (for building surfaces only and if IbldCHmod == 0 in ESTMinput.nml)              |
| 51 | O  | Internal_CHroof     |   | Bulk transfer coefficient of internal roof [ $\text{W m}^{-2} \text{K}^{-1}$ ] (for building surfaces only and if IbldCHmod == 0 in ESTMinput.nml)              |
| 52 | O  | Internal_CHbld      |   | Bulk transfer coefficient of internal building elements [ $\text{W m}^{-2} \text{K}^{-1}$ ] (for building surfaces only and if IbldCHmod == 0 in ESTMinput.nml) |

### Additional ESTM-related files

Depending on how the storage heat flux is calculated (specified by StorageHeatMethod in RunControl.nml), different input files are required:

| Option       | StorageHeatMethod | Files needed  |
|--------------|-------------------|---|
| OHM          | 1                 | <ul style="list-style-type: none"> <li>Coefficients a1, a2, a3 specified in SUEWS_OHMCoefficients.txt</li> </ul>  |
| Observations | 2                 | <ul style="list-style-type: none"> <li>Storage heat flux is provide in meteorological forcing file</li> </ul>   |
| AnOHM        | 3                 | <ul style="list-style-type: none"> <li>Thermal properties specified with other site characteristics in SUEWS_NonVeg.txt, SUEWS_Veg.txt, SUEWS_Water.txt and SUEWS_Snow.txt</li> </ul>   |
| ESTM         | 4                 | <ul style="list-style-type: none"> <li>Properties of each element specified in SUEWS_ESTMCoefficients.txt</li> <li>Model options specified in ESTMinput.nml</li> <li>Time-series of surface temperatures provided in SSss_YYYY_ESTM_Ts_data_tt.txt</li> </ul> |

**Note ESTM is under development in v2017a and should not be used!**

The following input files are required if ESTM is used to calculate the storage heat flux.

### ESTMinput.nml

ESTMinput.nml specifies the model settings and default values.

- The file contents can be in any order.

| Name               | Description  |
|--------------------|--|
| <b>TsurfChoice</b> | <b>Source of surface temperature data used.</b>  |
|                    | 0 *Tsurf in SSss_YYYY_ESTM_Ts_data_tt.txt used for <b>all</b> surface elements.  |
|                    | 1 *Tground, Troof and Twall in SSss_YYYY_ESTM_Ts_data_tt.txt used. <ul style="list-style-type: none"> <li>Input surface temperature are different for ground, roof and wall.</li> </ul>                      |
|                    | 2 *Tground, Troof, Twall_n, Twall_e, Twall_s and Twall_w in SSss_YYYY_ESTM_Ts_data_tt.txt used. <ul style="list-style-type: none"> <li>Wall surface temperature is different for four directions.</li> </ul> |
| <b>evolveTibld</b> | <b>Source of internal building temperature (Tibld)</b>   |
|                    | 0 *Ti air in SSss_YYYY_ESTM_Ts_data_tt.txt used.   |
|                    | 1 *Tibld calculated considering the effect of anthropogenic heat from HVAC   |
|                    | 2 *Tibld calculated without considering the influence of HVAC.   |
| <b>IbldCHmod</b>   | <b>Method to calculate internal convective heat exchange coefficients (CH) for internal building, wall and roof if evolveTibld is 1 or 2.</b>  |
|                    | 0 CHs are read from SUEWS_ESTMcoefficients.txt.  |
|                    | 1 CHs are calculated based on ASHRAE (2001)  |
|                    | 2 CHs are calculated based on Awbi (1998).   |
| <b>LBC_soil</b>    | <b>Soil temperature at lowest boundary condition [<math>^{\circ}\text{C}</math>]</b>   |
| <b>Theat_on</b>    | <b>Temperature at which heat control is turned on (used when evolveTibld =1) [<math>^{\circ}\text{C}</math>]</b>   |
| <b>Theat_off</b>   | <b>Temperature at which heat control is turned off (used when evolveTibld=1) [<math>^{\circ}\text{C}</math>]</b>   |
| <b>Theat_fix</b>   | <b>Ideal internal building temperature [<math>^{\circ}\text{C}</math>]</b>   |

**SSss\_YYYY\_ESTM\_Ts\_data\_tt.txt**

SSss\_YYYY\_ESTM\_Ts\_data\_tt.txt contains a time-series of input surface temperature for roof, wall, ground and internal elements.

| No. | Column name | Description  |
|-----|-------------|--|
| 1   | iy          | Year [YYYY]  |
| 2   | id          | Day of year [DOY]  |
| 3   | it          | Hour [H]   |
| 4   | imin        | Minute [M]   |
| 5   | Tiair       | Indoor air temperature [°C]  |
| 6   | Tsurf       | Bulk surface temperature [°C] (used when TsurfCoice = 0)               |
| 7   | Troof       | Roof surface temperature [°C] (used when TsurfChoice = 1 or 2)         |
| 8   | Troad       | Ground surface temperature [°C] (used when TsurfChoice = 1 or 2)       |
| 9   | Twall       | Wall surface temperature [°C] (used when TsurfChoice = 1)              |
| 10  | Twall_n     | North-facing wall surface temperature [°C] (used when TsurfChoice = 2) |
| 11  | Twall_e     | East-facing wall surface temperature [°C] (used when TsurfChoice = 2)  |
| 12  | Twall_s     | South-facing wall surface temperature [°C] (used when TsurfChoice = 2) |
| 13  | Twall_w     | West-facing wall surface temperature [°C] (used when TsurfChoice = 2)  |

**Initial Conditions file**

To start the model, information about the conditions at the start of the run is required. This information is provided in initial conditions file. One file can be specified for each grid (MultipleInitFiles=1 in RunControl.nml, filename includes grid number) or, alternatively, a single file can be specified for all grids (MultipleInitFiles=0 in RunControl.nml, no grid number in the filename). After that, a new InitialConditionsSSss\_YYYY.nml file will be written for each grid for the following years. It is recommended that you look at these files (written to the input directory) to check the status of various surfaces at the end or the run. This may help you get more realistic starting values if you are uncertain what they should be. Note this file will be created for each year for multiyear runs for each grid. If the run finishes before the end of the year the InitialConditions file is still written and the file name is appended with '\_EndofRun'.

The two most important pieces of information in the initial conditions file is the soil moisture and state of vegetation at the start of the run. This is the minimal information required; other information can be provided if known, otherwise SUEWS will make an estimate of initial conditions.

**InitialConditionsSSss\_YYYY.nml**

- Variables can be in any order

| Parameters                   | Required/Optional | Unit | Comments  |
|------------------------------|-------------------|------|---|
| <b>Soil moisture states</b>  |                   |      |   |
| SoilstorePavedState          | R                 | mm   | Initial state of the soil water storage under paved surfaces. <ul style="list-style-type: none"> <li>For maximum values, see the used soil code in SUEWS_Soil.txt</li> </ul>  |
| SoilstoreBldgsState          | R                 | mm   | Initial state of the soil water storage under buildings <ul style="list-style-type: none"> <li>For maximum values, see the used soil code in SUEWS_Soil.txt</li> </ul>  |

## Meteorological input file

SUEWS is designed to run using commonly measured meteorological variables.

- Required inputs must be continuous – i.e. **gap fill** any missing data.
- The table below gives the required (R) and optional (O) additional input variables.
- If an optional input variable is not available or will not be used by the model, enter ‘-999.0’ for this column.
- Since v2017a forcing files no longer need to end with two rows containing ‘-9’ in the first column.
- One single meteorological file can be used for all grids (**MultipleMetFiles=0** in RunControl.nml, no grid number in file name) if appropriate for the study area, or separate met files can be used for each grid if data are available (**MultipleMetFiles=1** in RunControl.nml, filename includes grid number).
- The meteorological forcing file names should be appended with the temporal resolution in minutes (SS\_YYYY\_data\_tt.txt, or SSss\_YYYY\_data\_tt.txt for multiple grids).

- Separate met forcing files should be provided for each year.
- Files do not need to start/end at the start/end of the year, but they must contain a whole number of days.
- The meteorological input file should match the information given in SUEWS\_SiteSelect.txt.
- If a *partial year* is used that specific year must be given in SUEWS\_SiteSelect.txt.
- If *multiple years* are used, all years should be included in SUEWS\_SiteSelect.txt.
- If a *whole year* (e.g. 2011) is intended to be modelled using an hourly resolution dataset, the number of lines in the met data file should be 8760 and begin and end with:

```

iy      id      it      imin
2011    1        1        0 ...
...
2012    1        0        0 ...

```

### SSss\_YYYY\_data\_tt.txt

Main meteorological data file.

| No. | Use | Column name | Description   |
|-----|-----|-------------|---|
| 1   | R   | iy          | Year [YYYY]   |
| 2   | R   | id          | Day of year [DOY]   |
| 3   | R   | it          | Hour [H]  |
| 4   | R   | imin        | Minute [M]  |
| 5   | O   | qn          | Net all-wave radiation [ $\text{W m}^{-2}$ ]<br>▪ Required if <b>NetRadiationMethod</b> = 1.                      |
| 6   | O   | qh          | Sensible heat flux [ $\text{W m}^{-2}$ ]  |
| 7   | O   | qe          | Latent heat flux [ $\text{W m}^{-2}$ ]  |
| 8   | O   | qs          | Storage heat flux [ $\text{W m}^{-2}$ ]   |
| 9   | O   | qf          | Anthropogenic heat flux [ $\text{W m}^{-2}$ ]   |
| 10  | R   | U           | Wind speed [ $\text{m s}^{-1}$ ]<br>▪ Height of the wind speed measurement (z) is needed in SUEWS_SiteSelect.txt. |
| 11  | R   | RH          | Relative Humidity [%]   |
| 12  | R   | Tair        | Air temperature [ $^{\circ}\text{C}$ ]  |
| 13  | R   | pres        | Barometric pressure [kPa]   |
| 14  | R   | rain        | Rainfall [mm]   |
| 15  | R   | kdown       | Incoming shortwave radiation [ $\text{W m}^{-2}$ ]<br>▪ Must be $> 0 \text{ W m}^{-2}$ .                          |
| 16  | O   | snow        | Snow [mm]<br>▪ Required if <b>SnowUse</b> = 1   |
| 17  | O   | ldown       | Incoming longwave radiation [ $\text{W m}^{-2}$ ]   |
| 18  | O   | fcl         | Cloud fraction [tenths]   |
| 19  | O   | Wuh         | External water use [ $\text{m}^3$ ]   |
| 20  | O   | xsm         | Observed soil moisture [ $\text{m}^3 \text{ m}^{-3}$ or $\text{kg kg}^{-1}$ ]                                     |
| 21  | O   | lai         | Observed leaf area index [ $\text{m}^2 \text{ m}^{-2}$ ]  |
| 22  | O   | kdiff       | Diffuse radiation [ $\text{W m}^{-2}$ ]<br>▪ Recommended if <b>SOLWEIGUse</b> = 1                                 |
| 23  | O   | kdir        | Direct radiation [ $\text{W m}^{-2}$ ]<br>▪ Recommended if <b>SOLWEIGUse</b> = 1                                  |
| 24  | O   | wdir        | Wind direction [ $^{\circ}$ ]<br>▪ Currently not implemented  |

### CBL input files

Main references for this part of the model: Onomura et al. (2015)<sup>[17]</sup> and Cleugh and Grimmond (2001)<sup>[16]</sup>.

If CBL slab model is used (CBLuse=1 in RunControl.nml) the following files are needed:

| Filename             | Purpose   |
|----------------------|---|
| CBL_initial_data.txt | Gives initial data every morning when CBL slab model starts running. <ul style="list-style-type: none"> <li>filename must match the InitialData_FileName in CBLInput.nml.</li> <li>fixed format.</li> </ul> |
| CBLInput.nml         | Specifies run options, parameters and input file names. <ul style="list-style-type: none"> <li>Can be in any order</li> </ul>   |

#### CBL\_initial\_data.txt

This file should give initial data every morning when CBL slab model starts running. The file name should match the InitialData\_FileName in CBLInput.nml.

Definitions and example file of initial values prepared for Sacramento.

| No. | Column name | Description  |
|-----|-------------|--|
| 1   | id          | Day of year [DOY]  |
| 2   | zi0         | initial convective boundary layer height (m)   |
| 3   | gamt_Km     | vertical gradient of potential temperature ( $\text{K m}^{-1}$ ) strength of the inversion |
| 4   | gamq_gkgm   | vertical gradient of specific humidity ( $\text{g kg}^{-1} \text{m}^{-1}$ )                |
| 5   | Theta+_K    | potential temperature at the top of CBL (K)  |
| 6   | q+_gkg      | specific humidity at the top of CBL ( $\text{g kg}^{-1}$ )                                 |
| 7   | Theta_K     | potential temperature in CBL (K)   |
| 8   | q_gkg       | specific humidity in CBL ( $\text{g kg}^{-1}$ )  |

- gamt\_Km and gamq\_gkgm written to two significant figures are required for the model performance in appropriate ranges<sup>[17]</sup>.

| id  | zi0 | gamt_Km | gamq_gkgm | Theta+_K | q+_gkg | theta_K | q_gkg |

|                            | Value  | Comments   |
|                            | 0  | All initial values are calculated. (Not available in current release.)   |
|                            | 1  | Take zi0, gamt_Km and gamq_gkgm from input data file. Theta+_K, q+_gkg, Theta_K and q_gkg are calculated using Temp_C, avrh and Pres_kPa in meteorological input file. |
|                            | 2  | Take all initial values from input data file (see CBL_Initial_data.txt).   |
| <b>InitialDataFileName</b> | <b>If InitialData_use ≥ 1, write the file name including the path from site directory e.g. InitialDataFileName='CBLinputfiles\CBL_initial_data.txt'</b>  |  |
| <b>Sondeflag</b>           | Value  | Comments   |
|                            | 0  | Does not read radiosonde vertical profile data - <b>recommended</b>  |
|                            | 1  | Reads radiosonde vertical profile data   |
| <b>FileSonde(id)</b>       | <b>If Sondeflag=1, write the file name including the path from site directory<br/>e.g. FileSonde(id)= 'CBLinputfiles\XXX.txt', XXX is an arbitrary name.</b>   |  |

## SOLWEIG input files

If the SOLWEIG model option is used (SOLWEIGout=1), spatial data and a SOLWEIGInput.nml file need to be prepared. The Digital Surface Models (DSMs) as well as derivatives originating from DSMs, e.g. Sky View Factors (SVF) must have the same spatial resolution and extent. Since SOLWEIG is a 2D model it will considerably increase computation time and should be used with care.

Description of choices in SOLWEIGinput\_file.nml file. The file can be in any order.

| Name           | Units | Description   |
|----------------|-------|---|
| Posture        | -     | Determines the posture of a human for which the radiant fluxes should be considered   |
|                |       | 1 Standing (default)  |
|                |       | 2 Sitting   |
| absL           | -     | Absorption coefficient of longwave radiation of a person. <ul style="list-style-type: none"> <li>Recommended value: 0.97</li> </ul>   |
| absK           | -     | Absorption coefficient of shortwave radiation of a person. <ul style="list-style-type: none"> <li>Recommended value: 0.70</li> </ul>  |
| heightgravity  | m     | Centre of gravity for a person. <ul style="list-style-type: none"> <li>Recommended value for a standing man: 1.1 m</li> </ul>   |
| usevegdem      | -     | Vegetation scheme   |
|                |       | 1 Vegetation scheme is active (Lindberg and Grimmond 2011 <sup>[19]</sup> )   |
|                |       | 2 No vegetation scheme used   |
| DSMPath        | -     | Path to Digital Surface Models (DSM).   |
| DSMname        | -     | Ground and Building DSM   |
| CDSMname       | -     | Vegetation canopy DSM   |
| TDSMname       | -     | Vegetation trunk zone DSM   |
| TransMin       | -     | Transmissivity of K through deciduous vegetation (leaf on) <ul style="list-style-type: none"> <li>Recommended value: 0.02 (Konarska et al. 2014<sup>[40]</sup>)</li> </ul>  |
| TransMax       | -     | Transmissivity of K through deciduous vegetation (leaf off) <ul style="list-style-type: none"> <li>Recommended value: 0.50 (Konarska et al. 2014<sup>[40]</sup>)</li> </ul> |
| SVFPath        | -     | Path to SVFs matrices (See Lindberg and Grimmond (2011) <sup>[19]</sup> for details)  |
| SVFSuffix      | -     | Suffix used (if any)  |
| BuildingName   | -     | Boolean matrix for locations of building pixels   |
| row            | -     | X coordinate for point of interest. Here all variables from the model will be written to SOLWEIGpoiOUT.txt  |
| col            | -     | Y coordinate for point of interest. Here all variables from the model will be written to SOLWEIGpoiOUT.txt  |
| onlyglobal     | -     | Global radiation  |
|                |       | 0 Diffuse and direct shortwave radiation taken from met forcing file.   |
|                |       | 1 Diffuse and direct shortwave radiation calculated from Reindl et al. (1990) <sup>[41]</sup>   |
| SOLWEIGpoi_out | -     | Write output variables at point of interest (see below)   |
|                |       | 0 No POI output   |
| Tmrt_out       | -     | 0 No grid output  |
|                |       | 1 Write grid to file (saves as ERSI Ascii grid)   |
| Lup2d_out      | -     | 0 No grid output  |
|                |       | 1 Write grid to file (saves as ERSI Ascii grid)   |
| Ldown2d_out    | -     | 0 No grid output  |
|                |       | 1 Write grid to file (saves as ERSI Ascii grid)   |
| Kup2d_out      | -     | 0 No grid output  |
|                |       | 1 Write grid to file (saves as ERSI Ascii grid)   |
| Kdown2d_out    | -     | 0 No grid output  |
|                |       | 1 Write grid to file (saves as ERSI Ascii grid)   |
| GVF_out        | -     | 0 No grid output  |
|                |       | 1 Write grid to file (saves as ERSI Ascii grid)   |
| SOLWEIG_ldown  | -     | 0 Not active (use SUEWS to estimate Ldown above canyon)   |
|                |       | 1 Use SOLWEIG to estimate Ldown above canyon  |
| OutInterval    | min   | Output interval. Set to 60 in current version.  |
| RunForGrid     | -     | Grid for which SOLWEIG should be run.   |
|                |       | -999 All grids (use with care)  |

## Output files

### Error messages: problems.txt

If there are problems running the program serious error messages will be written to problems.txt.

- Serious problems will usually cause the program to stop after writing the error message. If this is the case, the last line of problems.txt will contain a non-zero number (the error code).
- If the program runs successfully, problems.txt file ends with

```
Run completed.
0
```

SUEWS has a large number of error messages included to try to capture common errors to help the user determine what the problem is. If you encounter an error that does not provide an error message please capture the details so we can hopefully provide better error messages in future.

See Troubleshooting section for help solving problems. If the file paths are not correct the program will return an error when run (see Preparing to run the model).

### Error messages: warnings.txt

- If the program encounters a more minor issue it will not stop but a warning may be written to warnings.txt. It is advisable to check the warnings to ensure there is not a more serious problem.
- The warnings.txt file can be large (over several GBs) given warning messages are written out during a large scale simulation, you can use `tail/head` to view the ending/starting part without opening the whole file on Unix-like systems (Linux/mac OS), which may slow down your system.
- To prevent warnings.txt from being written, set **SuppressWarnings** to 1 in RunControl.nml.
- Warning messages are usually written with a grid number, timestamp and error count. If the problem occurs in the initial stages (i.e. before grid numbers and timestamps are assigned, these are printed as 00000).

### Summary of model parameters: SS\_FileChoices.txt

For each run, the model parameters specified in the input files are written out to the file SS\_FileChoices.txt.

### Model output files

#### SSss\_YYYY\_TT.txt

SUEWS produces the main output file (SSss\_YYYY\_tt.txt) with time resolution (TT min) set by **ResolutionFilesOut** in RunControl.

Before these main data files are written out, SUEWS provides a summary of the column names, units and variables included in the file Ss\_YYYY\_TT\_OutputFormat.txt (one file per run).

The variables included in the main output file are determined according to **WriteOutOption** set in RunControl.nml.

| Column | Name    | WriteOutOption | Description  |
|--------|---------|----------------|--|
| 1      | Year    | 0,1,2          | Year [YYYY]  |
| 2      | DOY     | 0,1,2          | Day of year [DOY]  |
| 3      | Hour    | 0,1,2          | Hour [H]   |
| 4      | Min     | 0,1,2          | Minute [M]   |
| 5      | Dectime | 0,1,2          | Decimal time [-]   |
| 6      | Kdown   | 0,1,2          | Incoming shortwave radiation [ $\text{W m}^{-2}$ ]   |
| 7      | Kup     | 0,1,2          | Outgoing shortwave radiation [ $\text{W m}^{-2}$ ]   |
| 8      | Ldown   | 0,1,2          | Incoming longwave radiation [ $\text{W m}^{-2}$ ]  |
| 9      | Lup     | 0,1,2          | Outgoing longwave radiation [ $\text{W m}^{-2}$ ]  |
| 10     | Tsurf   | 0,1,2          | Bulk surface temperature [ $^{\circ}\text{C}$ ]  |
| 11     | QN      | 0,1,2          | Net all-wave radiation [ $\text{W m}^{-2}$ ]   |
| 12     | QF      | 0,1,2          | Anthropogenic heat flux [ $\text{W m}^{-2}$ ]  |
| 13     | QS      | 0,1,2          | Storage heat flux [ $\text{W m}^{-2}$ ]  |
| 14     | QH      | 0,1,2          | Sensible heat flux (calculated using SUEWS) [ $\text{W m}^{-2}$ ]  |
| 15     | QE      | 0,1,2          | Latent heat flux (calculated using SUEWS) [ $\text{W m}^{-2}$ ]  |
| 16     | QHlumps | 0,1            | Sensible heat flux (calculated using LUMPS) [ $\text{W m}^{-2}$ ]  |
| 17     | QElumps | 0,1            | Latent heat flux (calculated using LUMPS) [ $\text{W m}^{-2}$ ]  |
| 18     | QHresis | 0,1            | Sensible heat flux (calculated using resistance method) [ $\text{W m}^{-2}$ ] <b>Do not use in v2017a!</b> |
| 19     | Rain    | 0,1,2          | Rain [mm]  |
| 20     | Irr     | 0,1,2          | Irrigation [mm]  |
| 21     | Evap    | 0,1,2          | Evaporation [mm]   |
| 22     | RO      | 0,1,2          | Runoff [mm]  |

#### **SSss\_YYYY\_nn\_TT.nc (when ncMode=1 in RunControl)**

SUEWS can also produce the main output file in netCDF format by setting ncMode=1 (set in RunControl).

As the date and time information is incorporated in the netCDF output as separate dimension, the first five variables in the normal text output file (in .txt) are not included in the netCDF output but other variables are all kept.

N.B., considering the file size limit by the classic netCDF format, the output frequency is determined automatically by the internal SUEWS program setting to avoid the oversize problem in the netCDF files.

#### **SSss\_DailyState.txt**

Contains information about the state of the surface and soil and vegetation parameters at a time resolution of one day. One file is written for each grid so it may contain multiple years.

| Column | Name           | Description   |
|--------|----------------|---|
| 1      | iy             | Year [YYYY]   |
| 2      | id             | Day of year [DOY]   |
| 3      | HDD1_h         | Heating degree days [°C]  |
| 4      | HDD2_c         | Cooling degree days [°C]  |

#### InitialConditionsSSss\_YYYY.nml

At the end of the model run (or the end of each year in the model run) a new InitialConditions file is written out (to the input folder) for each grid, see InitialConditionsSSss\_YYYY.nml

#### SSss\_YYYY\_snow\_TT.txt

SUEWS produces a separate output file for snow (when snowUse = 1 in RunControl.nml) with details for each surface type.

File format of SSss\_YYYY\_snow\_60.txt

| Column | Name    | Description       |
|--------|---------|-------------------|
| 1      | iy      | Year [YYYY]       |
| 2      | id      | Day of year [DOY] |
| 3      | it      | Hour [H]          |
| 4      | imin    | Minute [M]        |
| 5      | dectime | Decimal time [-]  |

|    |              |  |
|----|--------------|--|
| 6  | SWE_Paved    | Snow water equivalent – paved surface [mm]   |

## Troubleshooting

### How to create a directory?

please search the web using this phrase if you do not know how to create a folder or directory

### How to unzip a file

please search the web using this phrase if you do not know how to unzip a file

### A text editor

is a program to edit plain text files. If you search on the web using the phrase ‘text editor’ you will find numerous programs. These include for example, NotePad, EditPad, Text Pad etc

### Command prompt

From Start select run –type cmd – this will open a window. Change directory to the location of where you stored your files. The following website may be helpful if you do not know what a command prompt is: <http://dosprompt.info/>

### Day of year [DOY]

January 1st is day 1, February 1st is day 32. If you search on the web using the phrase ‘day of year calendar’ you will find tables that allow rapid conversions. Remember that after February 28th DOY will be different between leap years and non-leap years.

### First things to Check if the program seems to have problems

- Check the problems.txt file.
- Check file options – in RunControl.nml.

- Look in the output directory for the SS\_FileChoices.txt. This allows you to check all options that were used in the run. You may want to compare it with the original version supplied with the model.

### A pop-up saying “file path not found”

This means the program cannot find the file paths defined in RunControl.nml file. Possible solutions:

- Check that you have created the folder that you specified in RunControl.nml.
- Check does the output directory exist?
- Check that you have a single or double quotes around the FileInputPath, FileOutputPath and FileCode

### “%sat\_vap\_press.f temp=0.0000 pressure dectime”

Temperature is zero and in calculation of water vapour pressure parameterization is used. You don’t need to worry if the temperature should be 0°C. If it should not be 0°C this suggests that there is a problem with the data.

### %T changed to fit limits

- [TL =0.1]/ [TL =39.9] You may want to change the coefficients for surface resistance. If you have data from these temperatures, we would happily determine them.

### %Iteration loop stopped for too stable conditions.

- [zL]/[USTAR] This warning indicates that the atmospheric stability gets above 2 values in which case the MO theory is not necessarily valid. In this case the iteration loop to calculate Obukhov length and friction velocity is stopped so that stability does not get too high values. This is something you do not need to worry as it does not mean wrong input data.

### “Reference to undefined variable, array element or function result”

- Parameter(s) missing from input files.

See also the error messages provided in problems.txt

## Acknowledgements

- People who have contributed to the development of SUEWS (plus co-authors of papers):
- Current contributors:
  - Prof C.S.B. Grimmond (University of Reading; previously Indiana University, King’s College London, UK); Dr Leena Järvi (University of Helsinki, Finland); Shiho Onomura (Göteborg University, Sweden), Dr Helen Ward (University of Reading), Dr Fredrik Lindberg (Göteborg University, Sweden), Dr Andy Gabey (Reading), Dr Ting SUN (Reading)
- Past Contributors:
  - Dr Brian Offerle (Indiana University), Dr Thomas Loridan (King’s College London)
- Users who have brought things to our attention to improve this manual and the model:
  - Dr Andy Coutts (Monash University, Australia), Kerry Nice (Monash University, Australia), Shiho Onomura (Göteborg University, Sweden), Dr Stefan Smith (University of Reading, UK), Dr Helen Ward (King’s College London, UK; University of Reading, UK); Duick Young (King’s College London), Dr Ning Zhang (Nanjing University, China)

## Development

1. Coding Guidelines ([http://urban-climate.net/umep/DevelopmentGuidelines#Coding\\_Guidelines%7C](http://urban-climate.net/umep/DevelopmentGuidelines#Coding_Guidelines%7C))

## Version History

### New in SUEWS Version 2017b (released 1 August 2017)

1. Surface-level diagnostics: T2 (air temperature at 2 m agl), Q2 (air specific humidity at 2 m agl) and U10 (wind speed at 10 m agl) added as default output.
2. Edits to the manual.
3. New capabilities being developed, including two new options for calculating storage heat flux (AnOHM, ESTM) and modelling of carbon dioxide fluxes. These are currently under development and **should not be used** in v2017a.

### New in SUEWS Version 2017a (Feb 2017)

1. Changes to input file formats (including RunControl.nml and InitialConditions files) to facilitate setting up and running the model. Met forcing files no longer need two rows of -9 at the end to indicate the end of the file.
2. Changes to output file formats (now option to write out only a subset of variables, rather than all variables).
3. SUEWS can now disaggregate forcing files to the model time-step and aggregate output at the model time-step to lower resolution. This removes the need for the

python wrapper used with previous versions.

4. InitialConditions format and requirements changed. A single file can now be provided for multiple grids. SUEWS will approximate most (but not all) of the required initial conditions if values are unknown. (However, if detailed information about the initial conditions is known, this can still be provided to and used by SUEWS.)
5. Leaf area index calculations now use parameters provided for each vegetated surface (previously only the deciduous tree LAI development parameters were applied to all vegetated surfaces).
6. For compatibility with GIS, **the sign convention for longitude has been changed**. Now negative values are to the west, positive values are to the east. Note this appears to have been incorrectly coded in previous versions (but may not necessarily have been problematic).
7. Storage heat flux calculation adapted for shorter (sub-hourly) model time-step: hysteresis calculation now based on running means over the previous hour.
8. Improved error handling, including separate files for serious errors (problems.txt) and less critical issues (warnings.txt).
9. Edits to the manual.
10. New capabilities being developed, including two new options for calculating storage heat flux (AnOHM, ESTM) and modelling of carbon dioxide fluxes. These are currently under development and **should not be used** in v2017a.

## New in SUEWS Version 2016a (released 21 June 2016)

### PDF Manual for v2016a

1. Major changes to the input file formats to facilitate the running of multiple grids and multiple years. Surface characteristics are provided in SiteSelect.txt and other input files are cross-referenced via codes or profile types.
2. The surface types have been altered:
  - Previously, grass surfaces were entered separately as irrigated grass and unirrigated grass surfaces, whilst the 'unmanaged' land cover fraction was assumed by the model to behave as unirrigated grass. There is now a single surface type for grass (total for irrigated plus unirrigated) and a new bare soil surface type.
  - The proportion of irrigated vegetation must now be specified for grass, evergreen trees and deciduous trees individually.
3. The entire model now runs at a time step specified by the user. Note that 5 min is strongly recommended. (Previously only the water balance calculations were done at 5 min with the energy balance calculations at 60 min).
4. Surface conductance now depends on the soil moisture under the vegetated surfaces only (rather than the total soil moisture for the whole study area as previously).
5. Albedo of evergreen trees and grass surfaces can now change with leaf area index as was previously possible for deciduous trees only.
6. New suggestions in Troubleshooting section.
7. Edits to the manual.
8. CBL model included.
9. SUEWS has been incorporated into UMEP (<http://urban-climate.net/umep/UMEP>)

## New in SUEWS Version 2014b (released 8 October 2014)

[V2014 manual ([http://www.met.rdg.ac.uk/micromet/documents/SUEWS\\_Manual.pdf%7C](http://www.met.rdg.ac.uk/micromet/documents/SUEWS_Manual.pdf%7C))] These affect the run configuration if previously run with older versions of the model:

1. New input of three additional columns in the Meteorological input file (diffusive and direct solar radiation, and wind direction)
2. Change of input variables in InitialConditions.nml file. Note we now refer to CT as ET (ie. Evergreen trees rather than coniferous trees)
3. In GridConnectionsYYYY.txt, the site names should now be without the underscore (e.g "Sm" and not "Sm\_")

### Other issues:

1. Number of grid areas that can be modelled (for one grid, one year 120; for one grid two years 80)
2. Comment about Time interval of input data
3. Bug fix: Column headers corrected in 5 min file
4. Bug fix: Surface state 60 min file - corrected to give the last 5 min of the hour (rather than cumulating through the hour)
5. Bug fix: units in the Horizontal soil water transfer
6. ErrorHints: More have been added to the problems.txt file.
7. Manual: new section on running the model appropriately
8. Manual: notation table updated
9. Possibility to add snow accumulation and melt: new paper

Järvi L, Grimmond CSB, Taka M, Nordbo A, Setälä H, and Strachan IB 2014: Development of the Surface Urban Energy and Water balance Scheme (SUEWS) for cold climate cities, Geosci. Model Dev. 7, 1691-1711, doi:10.5194/gmd-7-1691-2014.

## New in SUEWS Version 2014a.1 (released February 26, 2014)

1. Please see the large number of changes made in the 2014a release.
2. This is a minor change to address installing the software.
3. Minor updates to the manual

## New in SUEWS Version 2014a (released 21 Feb 2014)

1. Bug fix: External irrigation is calculated as combined from automatic and manual irrigation and during precipitation events the manual irrigation is reduced to 60% of the calculated values. In previous version of the model, the irrigation was in all cases taken 60% of the calculated value, but now this has been fixed.
2. In previous versions of the model, irrigation was only allowed on the irrigated grass surface type. Now, irrigation is also allowed on evergreen and deciduous trees/shrubs surfaces. These are not however treated as separate surfaces, but the amount of irrigation is evenly distributed to the whole surface type in the modelled area. The amount of water is calculated using same equation as for grass surface (equation 5 in Järvi et al. 2011), and the fraction of irrigated trees/shrubs (relative to the area of tree/shrubs surface) is set in the gis file (See Table 4.11: SSss\_YYYY.gis)
3. In the current version of the model, the user is able to adjust the leaf-on and leaf-off lengths in the FunctionalTypes.nml file. In addition, user can choose whether to use temperature dependent functions or combination of temperature and day length (advised to be used at high-latitudes)
4. In the gis-file, there is a new variable Alt that is the area altitude above sea level. If not known exactly use an approximate value.
5. Snow removal profile has been added to the HourlyProfileSSss\_YYYY.txt. Not yet used!
6. Model time interval has been changed from minutes to seconds. Preferred interval is 3600 seconds (1 hour)
7. Manual correction: input variable Soil moisture said soil moisture deficit in the manual – word removed
8. Multiple compiled versions of SUEWS released. There are now users in Apple, Linux and Windows environments. So we will now release compiled versions for more operating systems (section 3).
9. There are some changes in the output file columns so please, check the respective table of each used output file.
10. Bug fix: with very small amount of vegetation in an area – impacted Phenology for LUMPS

## New in SUEWS Version 2013a

1. Radiation selection bug fixed
2. Aerodynamic resistance – when very low - no longer reverts to neutral (which caused a large jump) – but stays low
3. Irrigation day of week fixed
4. New error messages
5. min file – now includes a decimal time column – see Section 5.4 – Table 5.3

## New in SUEWS Version 2012b

1. Error message generated if all the data are not available for the surface resistance calculations
2. Error message generated if wind data are below zero plane displacement height.
3. All error messages now written to 'Problem.txt' rather than embedded in an ErrorFile. Note some errors will be written and the program will continue others will stop the program.
4. Default variables removed (see below). Model will stop if any data are problematic. File should be checked to ensure that reasonable data are being used. If an error occurs when there should not be one let us know as it may mean we have made the limits too restrictive.

Contents no longer used File defaultFcd=0.1 defaultPres=1013 defaultRH=50 defaultT=10 defaultU=3 RunControl.nml

- Just delete lines from file
- Values you had were likely different from these example value shown here

## New in SUEWS Version 2012a

1. Improved error messages when an error is encountered. Error message will generally be written to the screen and to the file 'problems.txt'
2. Format of all input files have changed.
3. New excel spreadsheet and R programme to help prepare required data files. (Not required)
4. Format of coef flux (OHM) input files have changed.
  - This allows for clearer identification for users of the coefficients that are actually to be used
  - This requires an additional file with coefficients. These do not need to be adjusted but new coefficients can be added. We would appreciate receiving additional coefficients so they can be included in future releases – Please email Sue.
5. Storage heat flux (OHM) coefficients can be changed by
  - time of year (summer, winter)
  - surface wetness state
6. New files are written: DailyState.txt
  - Provides the status of variables that are updated on a daily or basis or a snapshot at the end of each day.
7. Surface Types
  - Clarification of surface types has been made. See GIS and OHM related files

## New in SUEWS Version 2011b

1. Storage heat flux ( $\Delta Q_s$ ) and anthropogenic heat flux (QF) can be set to be 0 W m<sup>-2</sup>
2. Calculation of hydraulic conductivity in soil has been improved and HydraulicConduct in SUEWSInput.nml is replaced with name SatHydraulicConduct
3. Following removed from HeaderInput.nml
  - HydraulicConduct
  - GrassFractionIrrigated
  - PavedFractionIrrigated
  - TreeFractionIrrigated

The lower three are now determined from the water use behaviour used in SUEWS

1. Following added to HeaderInput.nml
  - SatHydraulicConduct
  - defaultQf
  - defaultQs
2. If  $\Delta Q_s$  and QF are not calculated in the model but are given as an input, the missing data is replaced with the default values.
3. Added to SAHP input file
  - AHDIUPRF – diurnal profile used if AnthropolHeatChoice = 1

V2012a this became obsolete OHM file (SSss\_YYYY.ohm)

## Differences between SUEWS, LUMPS and FRAISE

The largest difference between LUMPS and SUEWS is that the latter simulates the urban water balance in detail while LUMPS takes a simpler approach for the sensible and latent heat fluxes and the water balance ("water bucket"). The calculation of evaporation/latent heat in SUEWS is more biophysically based. Due to its simplicity, LUMPS requires less parameters in order to run. SUEWS gives turbulent heat fluxes calculated with both models as an output. **The model can run LUMPS alone without running SUEWS (Table 4.1 – SuewsStatus).**

Similarities and differences between LUMPS and SUEWS.

|                                    | LUMPS   | SUEWS  |
|------------------------------------|---|--|
| Net all-wave radiation (Q*)        | Input or NARP                                   | Input or NARP  |
| Storage heat flux ( $\Delta Q_S$ ) | Input or from OHM                               | Input or from OHM  |
| Anthropogenic heat flux (QF)       | Input or calculated                             | Input or calculated  |
| Latent heat (QE)                   | DeBruin and Holtslag (1982)                     | Penman-Monteith equation2  |
| Sensible heat flux (QH)            | DeBruin and Holtslag (1982)                     | Residual from available energy minus QE  |
| Water balance                      | No water balance included                       | Running water balance of canopy and water balance of soil                                |
| Soil moisture                      | Not considered                                  | Modelled   |
| Surface wetness                    | Simple water bucket model                       | Running water balance  |
| Irrigation                         | Only fraction of surface area that is irrigated | Input or calculated with a simple model  |
| Surface cover                      | buildings, paved, vegetation                    | buildings, paved, coniferous and deciduous trees/shrubs, irrigated and unirrigated grass |

### FRAISE Flux Ratio – Active Index Surface Exchange

FRAISE provides an estimate of mean midday ( $\pm 3$  h around solar noon) energy partitioning from information on the surface characteristics and estimates of the mean midday incoming radiative energy and anthropogenic heat release. Please refer to Loridan and Grimmond (2012)<sup>[42]</sup> for further details.

| Topic                     | FRAISE                                 | LUMPS                            | SUEWS   |
|---------------------------|--|----------------------------------|---|
| <b>Complexity</b>         | Simplest: FRAISE                       |                                  | More complex: SUEWS   |
| <b>Software provided:</b> | R code                                 | Windows exe (written in Fortran) | Windows exe (written in Fortran) - other versions available |
| <b>Applicable period:</b> | Midday (within 3 h of solar noon)      | hourly                           | 5 min-hourly-annual   |
| <b>Unique features:</b>   | calculates active surface – and fluxes | radiation and energy balances    | radiation, energy and water balance (includes LUMPS)        |
